Table of Contents

1 Introduction	18
Overview	18
Features.....	19
Device Information	21
Block Diagram	22
2 Document Conventions	23
3 System Architecture	24
Arm® Cortex®-M0+ Processor	24
Bus Architecture.....	25
Memory Organization	26
Memory Map.....	27
Embedded Flash Memory.....	29
Embedded SRAM Memory	29
AHB Peripherals	29
APB Peripherals	29
4 Flash Memory Controller (FMC)	30
Introduction	30
Features.....	30
Functional Descriptions	31
Flash Memory Map	31
Flash Memory Architecture	32
Booting Configuration	33
Page Erase	34
Mass Erase.....	35
Word Programming.....	36
Option Byte Description	37
Page Erase / Program Protection	38
Security Protection.....	39
Register Map	40
Register Descriptions.....	41
Flash Target Address Register – TADR	41
Flash Write Data Register – WRDR	42
Flash Operation Command Register – OCMR	43
Flash Operation Control Register – OPCR.....	44
Flash Operation Interrupt Enable Register – OIER	45
Flash Operation Interrupt and Status Register – OISR	46
Flash Page Erase / Program Protection Status Register – PPSR.....	48
Flash Security Protection Status Register – CPSR	49
Flash Vector Mapping Control Register – VMCR	50

Flash Manufacturer and Device ID Register – MDID.....	51
Flash Page Number Status Register – PNSR	52
Flash Page Size Status Register – PSSR	53
Device ID Register – DIDR	54
Custom ID Register n – CIDRn, n = 0 ~3	55
5 Power Control Unit (PWRCU)	56
Introduction	56
Features.....	57
Functional Descriptions	57
V _{DD} Power Domain.....	57
1.5 V Power Domain.....	59
Operation Modes	59
Register Map	60
Register Descriptions.....	61
Power Control Status Register – PWRSR	61
Power Control Register – PWRCR	62
Low Voltage / Brown Out Detect Control and Status Register – LVDCSR	64
6 Clock Control Unit (CKCU)	66
Introduction	66
Features.....	68
Function Descriptions	68
High Speed External Crystal Oscillator – HSE	68
High Speed Internal RC Oscillator – HSI.....	69
Auto Trimming of High Speed Internal RC Oscillator – HSI.....	69
Low Speed External Crystal Oscillator – LSE.....	71
Low Speed Internal RC Oscillator – LSI	71
Clock Ready Flag	71
System Clock (CK_SYS) Selection	71
HSE Clock Monitor	72
Clock Output Capability	72
Register Map	73
Register Descriptions.....	74
Global Clock Configuration Register – GCFGR.....	74
Global Clock Control Register – GCCR.....	75
Global Clock Status Register – GCSR	77
Global Clock Interrupt Register – GCIR.....	78
AHB Configuration Register – AHBCFGR	79
AHB Clock Control Register – AHBCCR	80
APB Configuration Register – APBCFGR.....	81
APB Clock Control Register 0 – APBCCR0.....	82
APB Clock Control Register 1 – APBCCR1.....	83
Clock Source Status Register – CKST	84

APB Peripheral Clock Selection Register 0 – APBPCSR0	85
APB Peripheral Clock Selection Register 1 – APBPCSR1	86
HSI Control Register – HSICR.....	87
HSI Auto Trimming Counter Register – HSIATCR	89
APB Peripheral Clock Selection Register 2 – APBPCSR2	90
MCU Debug Control Register – MCUDBGCR.....	91
7 Reset Control Unit (RSTCU)	93
Introduction	93
Functional Descriptions	94
Power On Reset	94
System Reset	94
AHB and APB Unit Reset.....	94
Register Map	95
Register Descriptions.....	95
Global Reset Status Register – GRSR	95
AHB Peripheral Reset Register – AHBPRSTR	96
APB Peripheral Reset Register 0 – APBPRSTR0	97
APB Peripheral Reset Register 1 – APBPRSTR1	98
8 General Purpose I/O (GPIO).....	99
Introduction	99
Features.....	100
Functional Descriptions	100
Default GPIO Pin Configuration.....	100
General Purpose I/O – GPIO	100
GPIO Locking Mechanism.....	102
Register Map	102
Register Descriptions.....	103
Port A Data Direction Control Register – PADIRCR	103
Port A Input Function Enable Control Register – PAINER	104
Port A Pull-Up Selection Register – PAPUR	105
Port A Pull-Down Selection Register – PAPDR	106
Port A Open-Drain Selection Register – PAODR	107
Port A Output Drive Current Selection Register – PADRVR	108
Port A Lock Register – PALOCKR	109
Port A Data Input Register – PADINR	110
Port A Output Data Register – PADOUTR	110
Port A Output Set / Reset Control Register – PASRR	111
Port A Output Reset Register – PARR	112
Port A Sink Current Enhanced Selection Register – PASCER	112
Port B Data Direction Control Register – PBDIRCR	113
Port B Input Function Enable Control Register – PBINER	114
Port B Pull-Up Selection Register – PBPUR	115

Port B Pull-Down Selection Register – PBPDR	116
Port B Open-Drain Selection Register – PBODR	117
Port B Output Drive Current Selection Register – PBDRVVR	118
Port B Lock Register – PBLOCKR.....	119
Port B Data Input Register – PBDINR	120
Port B Output Data Register – PBDOUTR	120
Port B Output Set / Reset Control Register – PBSRR.....	121
Port B Output Reset Register – PBRR	122
Port B Sink Current Enhanced Selection Register – PBSKER.....	122
Port C Data Direction Control Register – PCDIRCR	123
Port C Input Function Enable Control Register – PCINER	124
Port C Pull-Up Selection Register – PCPUR	125
Port C Pull-Down Selection Register – PCPDR	126
Port C Open Drain Selection Register – PCODR	127
Port C Output Current Drive Selection Register – PCDRVVR	128
Port C Lock Register – PCLOCKR	129
Port C Data Input Register – PCDINR.....	130
Port C Output Data Register – PCDOUTR	130
Port C Output Set / Reset Control Register – PCSRR	131
Port C Output Reset Register – PCRR.....	132
Port C Sink Current Enhanced Selection Register – PCSCER	132
9 Alternate Function Input / Output Control Unit (AFIO).....	133
Introduction	133
Features.....	134
Functional Descriptions	134
External Interrupt Pin Selection	134
Alternate Function.....	135
Lock Mechanism	135
Register Map	135
Register Descriptions.....	136
EXTI Source Selection Register 0 – ESSR0	136
EXTI Source Selection Register 1 – ESSR1	137
GPIO x Configuration Low Register – GPxCFGRL, x = A, B, C	138
GPIO x Configuration High Register – GPxCFGHR, x = A, B, C	139
10 Nested Vectored Interrupt Controller (NVIC).....	140
Introduction	140
Features.....	141
Function Descriptions	142
SysTick Calibration	142
Register Map	142
11 External Interrupt / Event Controller (EXTI).....	143

Introduction	143
Features.....	143
Function Descriptions	144
Wakeup Event Management.....	144
External Interrupt / Event Line Mapping	145
Interrupt and Debounce.....	145
Register Map	146
Register Descriptions.....	147
EXTI Interrupt n Configuration Register – EXTICFGRn, n = 0 ~ 15	147
EXTI Interrupt Control Register – EXTICR	148
EXTI Interrupt Edge Flag Register – EXTIEDGEFLGR.....	149
EXTI Interrupt Edge Status Register – EXTIEDGESR	150
EXTI Interrupt Software Set Command Register – EXTISSCR.....	151
EXTI Interrupt Wakeup Control Register – EXTIWAKUPCR	152
EXTI Interrupt Wakeup Polarity Register – EXTIWAKUPPOLR	153
EXTI Interrupt Wakeup Flag Register – EXTIWAKUPFLG	154
12 Analog to Digital Converter (ADC)	155
Introduction	155
Features.....	156
Function Descriptions	157
ADC Clock Setup.....	157
Channel Selection.....	157
Conversion Mode.....	157
Start Conversion on External Event.....	160
Sampling Time Setting.....	161
Data Format.....	161
Analog Watchdog.....	161
Interrupts.....	162
Register Map	163
Register Descriptions.....	164
ADC Conversion Control Register – ADCCR	164
ADC Conversion List Register 0 – ADCLST0	166
ADC Conversion List Register 1 – ADCLST1.....	167
ADC Input Sampling Time Register – ADCSTR.....	168
ADC Conversion Data Register y – ADCDRy, y = 0 ~ 7	169
ADC Trigger Control Register – ADCTCR	170
ADC Trigger Source Register – ADCTS.....	171
ADC Watchdog Control Register – ADCWCR	172
ADC Watchdog Threshold Register – ADCTR.....	173
ADC Interrupt Enable Register – ADCIER	174
ADC Interrupt Raw Status Register – ADCIRAW	175
ADC Interrupt Status Register – ADCISR.....	176
ADC Interrupt Clear Register – ADCICLR	177

13 General-Purpose Timer (GPTM)	178
Introduction	178
Features.....	178
Functional Descriptions	179
Counter Mode.....	179
Clock Controller	182
Trigger Controller.....	183
Slave Controller	184
Master Controller	186
Channel Controller.....	187
Input Stage	190
Quadrature Decoder	192
Output Stage.....	194
Update Management.....	198
Single Pulse Mode.....	199
Asymmetric PWM Mode	201
Timer Interconnection	202
Trigger ADC Start.....	205
Register Map	205
Register Descriptions.....	206
Timer Counter Configuration Register – CNTCFR	206
Timer Mode Configuration Register – MDCFR.....	207
Timer Trigger Configuration Register – TRCFR.....	210
Timer Counter Register – CTR	211
Channel 0 Input Configuration Register – CH0ICFR.....	212
Channel 1 Input Configuration Register – CH1ICFR.....	213
Channel 2 Input Configuration Register – CH2ICFR.....	215
Channel 3 Input Configuration Register – CH3ICFR	216
Channel 0 Output Configuration Register – CH0OCFR	217
Channel 1 Output Configuration Register – CH1OCFR	219
Channel 2 Output Configuration Register – CH2OCFR	221
Channel 3 Output Configuration Register – CH3OCFR	223
Channel Control Register – CHCTR.....	225
Channel Polarity Configuration Register – CHPOLR.....	226
Timer Interrupt Control Register – DICTR	227
Timer Event Generator Register – EVGR.....	228
Timer Interrupt Status Register – INTSR	229
Timer Counter Register – CNTR.....	231
Timer Prescaler Register – PSCR	232
Timer Counter Reload Register – CRR	233
Channel 0 Capture / Compare Register – CH0CCR	234
Channel 1 Capture / Compare Register – CH1CCR	235
Channel 2 Capture / Compare Register – CH2CCR	236
Channel 3 Capture / Compare Register – CH3CCR	237

Channel 0 Asymmetric Compare Register – CH0ACR.....	238
Channel 1 Asymmetric Compare Register – CH1ACR.....	238
Channel 2 Asymmetric Compare Register – CH2ACR.....	239
Channel 3 Asymmetric Compare Register – CH3ACR.....	239
14 Pulse Width Modulator (PWM).....	240
Introduction	240
Features.....	241
Functional Descriptions	241
Counter Mode	241
Clock Controller	244
Trigger Controller	245
Slave Controller	246
Master Controller	248
Channel Controller.....	249
Output Stage.....	249
Update Management	253
Single Pulse Mode	253
Asymmetric PWM Mode	256
Timer Interconnection	256
Trigger Peripherals Start.....	258
Register Map	259
Register Descriptions.....	260
Timer Counter Configuration Register – CNTCFR	260
Timer Mode Configuration Register – MDCFR.....	261
Timer Trigger Configuration Register – TRCFR.....	264
Timer Counter Register – CTR	265
Channel 0 Output Configuration Register – CH0OCFR	266
Channel 1 Output Configuration Register – CH1OCFR.....	268
Channel 2 Output Configuration Register – CH2OCFR	270
Channel 3 Output Configuration Register – CH3OCFR	272
Channel Control Register – CHCTR.....	274
Channel Polarity Configuration Register – CHPOLR.....	275
Timer Interrupt Control Register – DICTR	276
Timer Event Generator Register – EVGR.....	277
Timer Interrupt Status Register – INTSR.....	278
Timer Counter Register – CNTR.....	279
Timer Prescaler Register – PSCR	280
Timer Counter Reload Register – CRR	280
Channel 0 Compare Register – CH0CR.....	281
Channel 1 Compare Register – CH1CR.....	281
Channel 2 Compare Register – CH2CR.....	282
Channel 3 Compare Register – CH3CR.....	282
Channel 0 Asymmetric Compare Register – CH0ACR.....	283
Channel 1 Asymmetric Compare Register – CH1ACR.....	283

Channel 2 Asymmetric Compare Register – CH2ACR.....	284
Channel 3 Asymmetric Compare Register – CH3ACR.....	284
15 Basic Function Timer (BFTM).....	285
Introduction	285
Features.....	285
Functional Description	286
Repetitive Mode.....	286
One Shot Mode.....	287
Trigger ADC Start.....	287
Register Map	288
Register Descriptions.....	288
BFTM Control Register – BFTMCR	288
BFTM Status Register – BFTMSR.....	289
BFTM Counter Value Register – BFTMCNTR	290
BFTM Compare Value Register – BFTMCMPPR	290
16 Real Time Clock (RTC)	291
Introduction	291
Features.....	291
Functional Descriptions	292
RTC Related Register Reset	292
Low Speed Clock Configuration	292
RTC Counter Operation.....	292
Interrupt and Wakeup Control.....	292
RTCOUT Output Pin Configuration.....	293
Register Map	294
Register Descriptions.....	294
RTC Counter Register – RTCCNT.....	294
RTC Compare Register – RTCCMP	295
RTC Control Register – RTCCR.....	296
RTC Status Register – RTCSR.....	298
RTC Interrupt and Wakeup Enable Register – RTCIWIN.....	299
17 Watchdog Timer (WDT)	300
Introduction	300
Features.....	300
Functional Description	301
Register Map	303
Register Descriptions.....	303
Watchdog Timer Control Register – WDTCR	303
Watchdog Timer Mode Register 0 – WDTMR0.....	304
Watchdog Timer Mode Register 1 – WDTMR1.....	305

Watchdog Timer Status Register – WDTSR.....	306
Watchdog Timer Protection Register – WDTPR.....	307
Watchdog Timer Clock Selection Register – WDTCSR.....	308
18 Inter-Integrated Circuit (I²C).....	309
Introduction	309
Features.....	310
Functional Descriptions	310
Two-Wire Serial Interface	310
START and STOP Conditions.....	310
Data Validity.....	311
Addressing Format	312
Data Transfer and Acknowledge.....	314
Clock Synchronization	315
Arbitration	315
General Call Addressing.....	316
Bus Error.....	316
Address Mask Enable.....	316
Address Snoop	316
Operation Mode	316
Conditions of Holding SCL Line.....	322
I ² C Timeout Function	323
Register Map	323
Register Descriptions.....	324
I ² C Control Register – I2CCR	324
I ² C Interrupt Enable Register – I2CIER	326
I ² C Address Register – I2CADDR.....	328
I ² C Status Register – I2CSR	329
I ² C SCL High Period Generation Register – I2CSHPGR.....	332
I ² C SCL Low Period Generation Register – I2CSLPGR	333
I ² C Data Register – I2CDR	334
I ² C Target Register – I2CTAR	335
I ² C Address Mask Register – I2CADDNR	336
I ² C Address Snoop Register – I2CADDSSR	337
I ² C Timeout Register – I2CTOUT.....	338
19 Serial Peripheral Interface (SPI)	339
Introduction	339
Features.....	340
Function Descriptions	340
Master Mode.....	340
Slave Mode.....	340
SPI Serial Frame Format.....	341
Status Flags.....	345
Register Map	347

Register Descriptions.....	348
SPI Control Register 0 – SPICR0	348
SPI Control Register 1 – SPICR1	350
SPI Interrupt Enable Register – SPIIER	351
SPI Clock Prescaler Register – SPICPR	352
SPI Data Register – SPIDR	353
SPI Status Register – SPISR.....	354
SPI FIFO Control Register – SPIFCR.....	356
SPI FIFO Status Register – SPIFSR	357
SPI FIFO Time Out Counter Register – SPIFTOCR	358
20 Universal Asynchronous Receiver Transmitter (UART).....	359
Introduction	359
Features.....	360
Function Descriptions	360
Serial Data Format.....	360
Baud Rate Generation	361
Interrupts and Status	362
Register Map	362
Register Descriptions.....	363
UART Data Register – URDR.....	363
UART Control Register – URCR.....	364
UART Interrupt Enable Register – URIER	365
UART Status & Interrupt Flag Register – URSIFR	366
UART Divider Latch Register – URDLR	368
UART Test Register – URTSTR.....	369
21 Divider (DIV)	370
Introduction	370
Features.....	370
Functional Descriptions	370
Register Map	371
Register Descriptions.....	371
Divider Control Register – CR	371
Dividend Data Register – DDR	372
Divisor Data Register – DSR	372
Quotient Data Register – QTR.....	373
Remainder Data Register – RMR	373

1 Introduction

Overview

This user manual provides detailed information including how to use the devices, system and bus architecture, memory organization and peripheral instructions. The target audiences for this document are software developers, application developers and hardware developers. For more information regarding pin assignment, package and electrical characteristics, please refer to the datasheet.

The devices are high performance and low power consumption 32-bit microcontrollers based around an Arm® Cortex®-M0+ processor core. The Cortex®-M0+ is a next-generation processor core which is tightly coupled with Nested Vectored Interrupt Controller (NVIC), SysTick timer and advanced debug support.

The devices operate at a frequency of up to 20 MHz for HT32F50220/50230 to obtain maximum efficiency. It provides up to 32 KB of embedded Flash memory for code / data storage and 4 KB of embedded SRAM memory for system operation and application program usage. A variety of peripherals, such as Hardware Divider DIV, ADC, I²C, UART, SPI, BFTM, GPTM, PWM, RTC, WDT and SW-DP (Serial Wire Debug Port), etc., are also implemented in the device series. Several power saving modes provide the flexibility for maximum optimization between wakeup latency and power consumption, which is an especially important consideration in low power applications.

The above features ensure that the devices are suitable for use in a wide range of applications, especially in areas such as white goods application control, power monitors, alarm systems, consumer products, handheld equipment, data logging applications, motor control and so on.

Features

- Core
 - 32-bit Arm® Cortex®-M0+ processor core
 - Up to 20 MHz operating frequency
 - Single-cycle multiplication
 - Integrated Nested Vectored Interrupt Controller (NVIC)
 - 24-bit SysTick timer
- On-chip Memory
 - Up to 32 KB on-chip Flash memory for instruction / data and option bytes storage
 - 4 KB on-chip SRAM
 - Supports multiple booting modes
- Flash Memory Controller – FMC
 - 32-bit word programming with In System Programming Interface (ISP) and In Application Programming (IAP)
 - Flash protection capability to prevent illegal access
- Reset Control Unit – RSTCU
 - Supply supervisor: Power On Reset / Power Down Reset (POR / PDR), Brown-out Detector (BOD) and Programmable Low Voltage Detector (LVD)
- Clock Control Unit – CKCU
 - External 4 to 20 MHz crystal oscillator
 - Internal 20 MHz RC oscillator trimmed to $\pm 2\%$ accuracy at 25 °C operating temperature
 - Internal 32 kHz RC oscillator
 - Independent clock divider and gating bits for peripheral clock sources
- Power Management – PWRCU
 - Flexible power supply:
 - V_{DD} power supply: 2.5 V to 5.5 V
 - V_{DDIO} power supply for I/O pins: 1.8 V to 5.5 V
 - Integrated 1.5 V LDO regulator for CPU core, peripherals and memories power supply
 - Three power domains: V_{DD} , V_{DDIO} and 1.5 V
 - Three power saving modes: Sleep, Deep-Sleep1, Deep-Sleep2
- External Interrupt / Event Controller – EXTI
 - Up to 16 EXTI lines with configurable trigger source and type
 - All GPIO pins can be selected as EXTI trigger source
 - Source trigger type includes high level, low level, negative edge, positive edge or both edge
 - Individual interrupt enable, wakeup enable and status bits for each EXTI line
 - Software interrupt trigger mode for each EXTI line
 - Integrated deglitch filter for short pulse blocking
- Analog to Digital Converter – ADC
 - 12-bit SAR ADC engine
 - Up to 1 Msps conversion rate
 - Up to 12 external analog input channels

- I/O ports – GPIO
 - Up to 40 GPIOs
 - Port A, B, C are mapped as 16 external interrupts – EXTI
 - Almost I/O pins are configurable output driving current
- PWM Generation and Capture Timer – GPTM
 - One 16-bit up, down, up / down auto-reload counter
 - Up to 4 independent channels for each timer
 - 16-bit programmable prescaler allowing the counter clock frequency division by any factor between 1 and 65536
 - Input Capture function
 - Compare Match Output
 - PWM waveform generation with Edge-aligned and Center-aligned Counting Modes
 - Single Pulse Mode Output
 - Encoder interface controller with two inputs using quadrature decoder
- Pulse Width Modulation – PWM
 - One 16-bit up, down, up / down auto-reload counter
 - Up to 4 independent channels for each timer
 - 16-bit programmable prescaler allowing counter clock frequency division by any factor between 1 and 65536
 - Compare Match Output
 - PWM waveform generation with Edge-aligned and Center-aligned Counting Modes
 - Single Pulse Mode Output
- Basic Function Timer – BFTM
 - One 32-bit compare / match count-up counter – No I/O control features
 - One shot mode – Counting stops after a match condition
 - Repetitive mode – Restart counter after a match condition
- Watchdog Timer – WDT
 - 12-bit down-counter with a 3-bit pre-scaler
 - Reset event for the system
 - Programmable watchdog timer window function
 - Registers write protection function
- Real Time Clock – RTC
 - 24-bit up-counter with a programmable prescaler
 - Alarm function
 - Interrupt and Wake-up event
- Inter-integrated Circuit – I²C
 - Supports both master and slave modes with a frequency of up to 1 MHz
 - Provides an arbitration function and clock synchronization
 - Supports 7-bit and 10-bit addressing modes and general call addressing
 - Supports slave multi-addressing mode with maskable address
- Serial Peripheral Interface – SPI
 - Supports both master and slave modes
 - Frequency of up to ($f_{PCLK}/2$) MHz for master mode and ($f_{PCLK}/3$) MHz for slave mode
 - FIFO Depth: 8 levels
 - Multi-master and multi-slave operation

- Universal Asynchronous Receiver Transmitter – UART
 - Asynchronous serial communication operating baud rate clock frequency of up to ($f_{PCLK}/16$) MHz
 - Capability of full duplex communication
 - Fully programmable characteristics of serial communication including: word length, parity bit, stop bit and bit order
 - Error detection: Parity, overrun and frame error
- Hardware Divider – DIV
 - Signed / unsigned 32-bit divider
 - Operation in 8 clock cycles, load in 1 clock cycle
 - Division by zero error flag
- Debug Support
 - Serial Wire Debug Port – SW-DP
 - 4 comparators for hardware breakpoint or code / literal patch
 - 2 comparators for hardware watchpoints
- Package and Operation Temperature
 - 24/28-pin SSOP, 28-pin SOP, 24/33-pin QFN and 44/48-pin LQFP package types
 - Operation temperature range: -40 °C to 85 °C

Device Information

Table 1. Features and Peripheral List

Peripherals	HT32F50220	HT32F50230
Main Flash (KB)	16	31
Option Bytes Flash (KB)	1	1
SRAM (KB)	4	4
Timers	GPTM	1
	PWM	2
	BFTM	1
	WDT	1
	RTC	1
Communication	SPI	1
	UART	1
	I ² C	1
Hardware Divider	1	
EXTI	16	
12-bit ADC	1	
Number of Channels	12 Channels	
GPIO	Up to 40	
CPU Frequency	Up to 20 MHz	
Operating Voltage	2.5 V ~ 5.5 V	
Operating Temperature	-40 °C ~ 85 °C	
Package	24/28-pin SSOP, 28-pin SOP, 24/33-pin QFN and 44/48-pin LQFP

Data read from these bits is not well defined and should be treated as random data. Normally these reserved bits should be set to a 0 value. Note that reserved bit must be kept at reset value.
1	0							
LLRDY	Reserved							
RO 0								
Word		Data length of a word is 32-bit.						
Half-word		Data length of a half-word is 16-bit.						
Byte		Data length of a byte is 8-bit.						

3 System Architecture

The system architecture of devices that includes the Arm® Cortex®-M0+ processor, bus architecture and memory organization will be described in the following sections. The Cortex®-M0+ is a next generation processor core which offers many new features. Integrated and advanced features make the Cortex®-M0+ processor suitable for market products that require microcontrollers with high performance and low power consumption. In brief, The Cortex®-M0+ processor includes AHB-Lite bus interface. All memory accesses of the Cortex®-M0+ processor are executed on the AHB-Lite bus according to the different purposes and the target memory spaces. The memory organization uses a Harvard architecture, pre-defined memory map and up to 4 GB of memory space, making the system flexible and extendable.

Arm® Cortex®-M0+ Processor

The Cortex®-M0+ processor is a very low gate count, highly energy efficient processor that is intended for microcontroller and deeply embedded applications that require an area optimized, low-power processor. The processor is based on the ARMv6-M architecture and supports Thumb® instruction sets; single-cycle I/O port; hardware multiplier and low latency interrupt respond time. Some system peripherals listed below are also provided by Cortex®-M0+:

- Internal Bus Matrix connected with AHB-Lite Interface, Single-cycle I/O port and Debug Accesses Port (DAP)
- Nested Vectored Interrupt Controller (NVIC)
- Optional Wakeup Interrupt Controller (WIC)
- Breakpoint and Watchpoint Unit
- Optional Memory Protection Unit (MPU)
- Serial Wire debug Port (SW-DP)
- Optional Micro Trace Buffer Interface (MTB)

The following figure shows the Cortex®-M0+ processor block diagram. For more information, refer to the Arm® Cortex®-M0+ Technical Reference Manual.

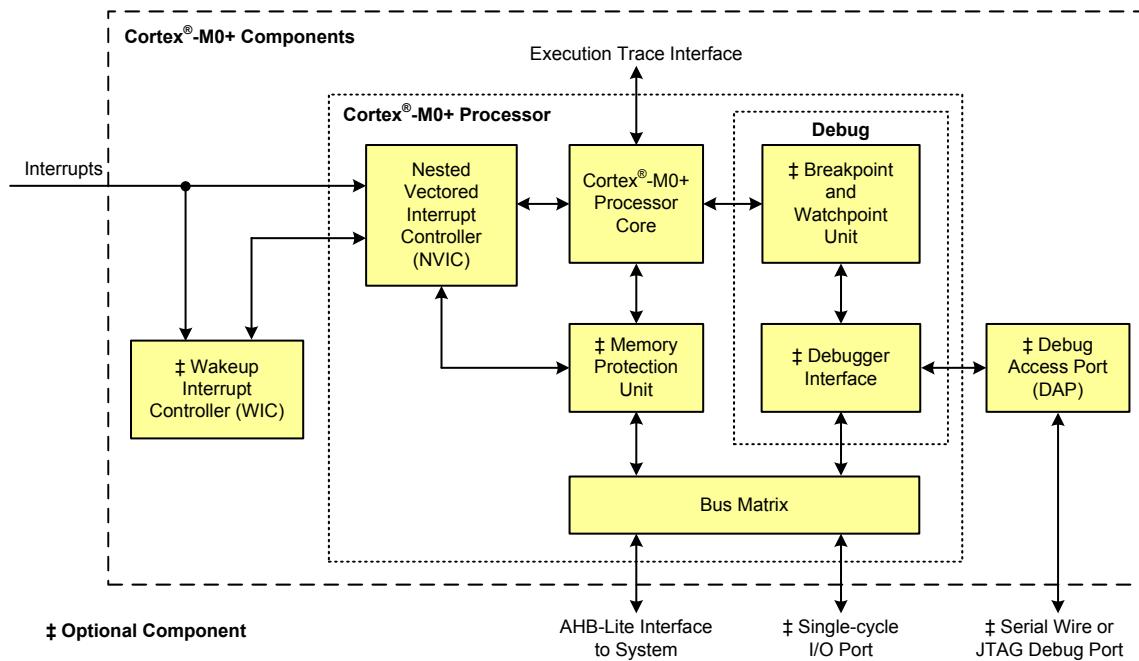

Figure 2. Cortex®-M0+ Block Diagram

Bus Architecture

The HT32F50220/50230 series devices consist of one master and four slaves in the bus architecture. The Cortex®-M0+ AHB-Lite bus is the master while the internal SRAM access bus, the internal Flash memory access bus, the AHB peripherals access bus and the AHB to APB bridges are the slaves. The single 32-bit AHB-Lite system interface provides simple integration to all system regions include the internal SRAM region and the peripheral region. All of the master buses are based on 32-bit Advanced High-performance Bus-Lite (AHB-Lite) protocol. The following figure shows the bus architecture of the HT32F50220/50230 series.

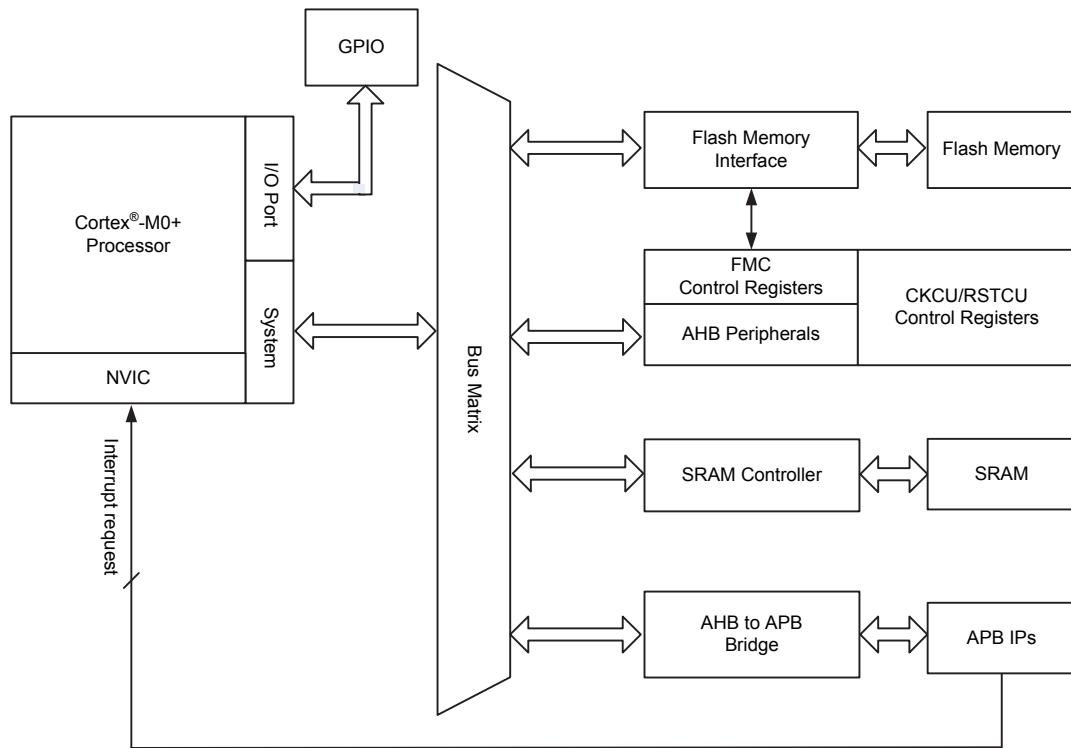

Figure 3. Bus Architecture

Memory Organization

The Arm® Cortex®-M0+ processor accesses and debug accesses share the single external interface to external AHB peripheral. The processor accesses take priority over debug accesses. The maximum address range of the Cortex®-M0+ is 4 GB since it has 32-bit bus address width. Additionally, a pre-defined memory map is provided by the Cortex®-M0+ processor to reduce the software complexity of repeated implementation of different device vendors. However, some regions are used by the Arm® Cortex®-M0+ system peripherals. Refer to the Arm® Cortex®-M0+ Technical Reference Manual for more information. The following figure shows the memory map of HT32F50220/50230 series of devices, including Code, SRAM, peripheral and other pre-defined regions.

Embedded Flash Memory

The HT32F50220/50230 series provide up to 32 KB on-chip Flash memory which is located at address 0x0000_0000. It supports byte, half-word and word access operations. Note that the Flash memory only supports read operations for the bus access. Any write operations to the Flash memory will cause a bus fault exception. The Flash memory has up to capacity of 32 pages. Each page has a memory capacity of 1 KB and can be erased independently. A 32-bit programming interface provides the capability of changing bits from 1 to 0. A data storage or firmware upgrade can be implemented using several methods such as In System Programming (ISP), In Application Programming (IAP) or In Circuit Programming (ICP). For more information, refer to the Flash Memory Controller section.

Embedded SRAM Memory

The HT32F50220/50230 series contain up to 4 KB on-chip SRAM which is located at address 0x2000_0000. It support byte, half-word and word access operations.

AHB Peripherals

The address of the AHB peripherals ranges from 0x4008_0000 to 0x400F_FFFF. Some peripherals such as Clock Control Unit, Reset Control Unit and Flash Memory Controller are connected to the AHB bus directly. The AHB peripherals clocks are always enabled after a system reset. Access to registers for these peripherals can be achieved directly via the AHB bus. Note that all peripheral registers in the AHB bus support only word access.

APB Peripherals

The address of APB peripherals ranges from 0x4000_0000 to 0x4007_FFFF. An APB to AHB Bridge provides access capability between the CPU and the APB peripherals. Additionally, the APB peripheral clocks are disabled after a system reset. Software must enable the peripheral clock by setting up the APBCCRn register in the Clock Control Unit before accessing the corresponding peripheral register. Note that the APB to AHB Bridge will duplicate the half-word or byte data to word width when a half-word or byte access is performed on the APB peripheral registers. In other words, the access result of a half-word or byte access on the APB peripheral register will vary depending on the data bit width of the access operation on the peripheral registers.

4

Flash Memory Controller (FMC)

Introduction

The Flash Memory Controller, FMC, provides functions of flash operation and pre-fetch buffer for the embedded on-chip Flash memory. Figure below shows the block diagram of FMC which includes programming interface, control register, pre-fetch buffer and access interface. Since the access speed of Flash memory is slower than the CPU, a wide access interface with pre-fetch buffer is provided to the Flash memory in order to reduce the CPU wait state, which will cause instruction gaps. The functions of word programming / page erase are also provided for instruction / data storage of Flash memory.

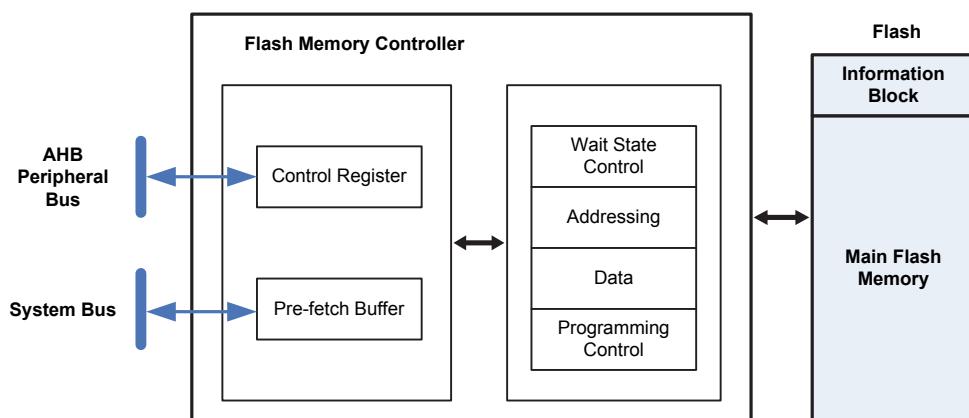

Figure 5. Flash Memory Controller Block Diagram

Features

- Up to 32 KB of on-chip Flash memory for storing instruction / data and option bytes
 - 32 KB (instruction / data + Option Byte)
 - 16 KB (instruction / data + Option Byte)
- Page size of 1 KB, totally up to 32 pages depending on the main Flash size
- Wide access interface with pre-fetch buffer to reduce instruction gaps
- Page erase and mass erase capability
- 32-bit word programming
- Interrupt capability when ready or error occurs
- Flash read protection to prevent illegal code / data access
- Page erase / program protection to prevent unexpected operation

Functional Descriptions

Flash Memory Map

The following figure is the Flash memory map of the system. The address ranges from 0x0000_0000 to 0xFFFF_FFFF (0.5 GB). The address from 0x1F00_0000 to 0x1F00_07FF is mapped to Boot Loader Block (2 KB). Besides, address 0xFF0_0000 to 0xFF0_03FF is the alias of Option Byte block (1 KB) which locates at the last page of main Flash physically. The memory mapping on system view is shown as below.

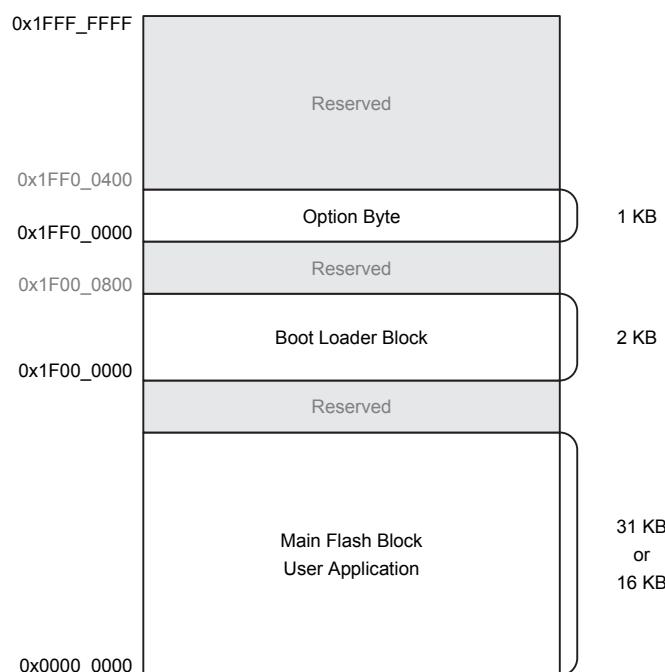

Figure 6. Flash Memory Map

Flash Memory Architecture

The Flash memory consists of up to 32 KB main Flash with 1 KB per page and 2 KB Information Block for Boot Loader. The main Flash memory contains totally 32 pages (or 16 pages for 16 KB device) which can be erased individually. The following table shows the base address, size and protection setting bit of each page.

Table 4. Flash Memory and Option Byte

Block	Name	Address	Page Protection Bit	Size
Main Flash Block	Page 0	0x0000_0000 ~ 0x0000_03FF	OB_PP [0]	1 KB
	Page 1	0x0000_0400 ~ 0x0000_07FF	OB_PP [1]	1 KB
	Page 2	0x0000_0800 ~ 0x0000_0BFF	OB_PP [2]	1 KB
	Page 3	0x0000_0C00 ~ 0x0000_0FFF	OB_PP [3]	1 KB
	:	:	:	:
	:	:	:	:
	Page 28	0x0000_7000 ~ 0x0000_73FF	OB_PP [28]	1 KB
	Page 29	0x0000_7400 ~ 0x0000_77FF	OB_PP [29]	1 KB
	Page 30	0x0000_7800 ~ 0x0000_7BFF	OB_PP [30]	1 KB
	Page 31 (Option Byte)	Physical: 0x0000_7C00 ~ 0x0000_7FFF Alias: 0x1FF0_0000 ~ 0x1FF0_03FF	OB_CP [1]	1 KB
Information Block	Boot Loader	0x1F00_0000 ~ 0x1F00_07FF	NA	2 KB

Notes: 1. Information Block stores boot loader – This block can not be programmed or erased by user.

2. Option Byte is always located at last page of main Flash block.

Booting Configuration

The system provides two kinds of booting mode which can be selected through the BOOT pin. The value of BOOT pin is sampled during the power-on reset or system reset. Once the logic value is decided, the first 4 words of vector will be remapped to the corresponding source according to the booting mode. The booting mode is shown in the following table.

Table 5. Booting Modes

Booting Mode Selection Pin	Mode	Descriptions
BOOT		
0	Boot Loader	The source of Vector is Boot Loader
1	Main Flash	The source of Vector is main Flash

The Flash Vector Mapping Control Register, VMCR, is provided to change the setting of the vector remapping temporarily after the chip reset. The reset value of VMCR is determined by the BOOT pin status which will be sampled during the reset duration.

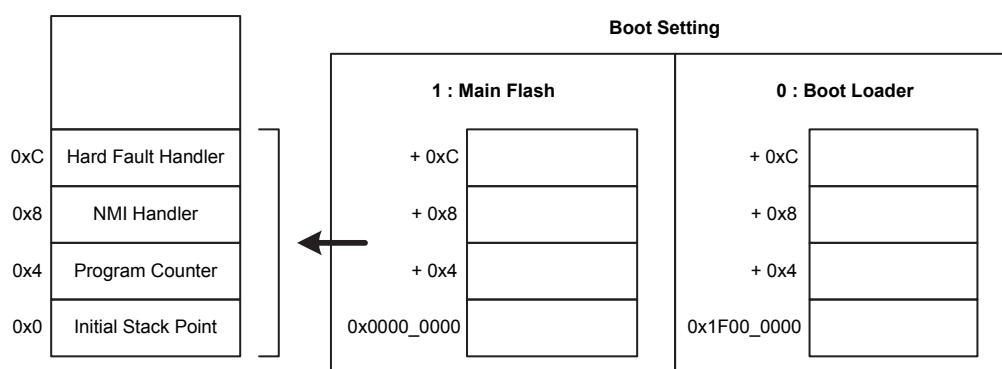

Figure 7. Vector Remapping

Page Erase

The FMC provides a page erase function which is used to reset partial content of Flash memory. Any page can be erased independently without affecting others. The following steps show the access sequence of the register for page erase.

- Check the OPCR register to confirm that no Flash memory operation is in progress (OPM [3:0] equals to 0xE or 0x6). Otherwise, wait until the previous operation has been finished.
- Write the page address to TADR register.
- Write the page erase command to OCMR register (Set CMD [3:0] = 0x8).
- Commit page erase command to FMC by setting OPCR register (Set OPM [3:0] = 0xA).
- Wait until all the operations have been completed by checking the value of OPCR register (OPM [3:0] equals to 0xE).
- Read and verify the page if required.

Note that a correct target page address must be confirmed. The software may run out of control if the target erase page is being used to fetch code or access data. The FMC will not provide any notification when this happens. Additionally, the page erase operation will be ignored on the protected pages. When this occurs, the OREF bit will be set by the FMC and then a Flash Operation Error interrupt will be generated if the OREIEN bit in the OIER register is set. The software can check the PPEF bit in the OISR register to detect this condition in the interrupt handler. The following figure shows the page erase operation flow.

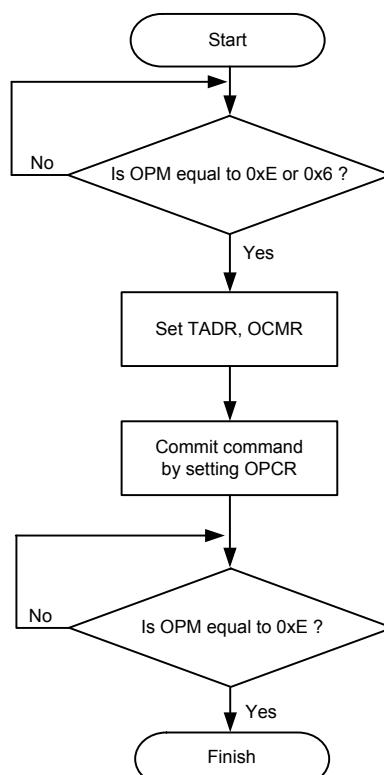

Figure 8. Page Erase Operation Flowchart

Mass Erase

The FMC provides a mass erase function which is used for resetting all the main Flash memory content. The following steps show the register access sequence for mass erase operation.

- Check OPCR register to confirm that no Flash memory operation is in progress (OPM [3:0] equals to 0xE or 0x6). Otherwise, wait until the previous operation has been finished.
- Write mass erase command to OCMR register (Set CMD [3:0] = 0xA).
- Commit mass erase command to FMC by setting OPCR register (Set OPM [3:0] = 0xA).
- Wait until all operations have been finished by checking the value of OPCR register (OPM [3:0] equals to 0xE).
- Read and verify the Flash memory if required.

Since all Flash data will be reset as 0xFFFF_FFFF, the mass erase operation can be implemented by the program that runs in the SRAM or by the debugging tool that accesses FMC registers directly. The software function that is executed on the Flash memory shall not trigger a mass erase operation. The following figure displays the mass erase operation flow.

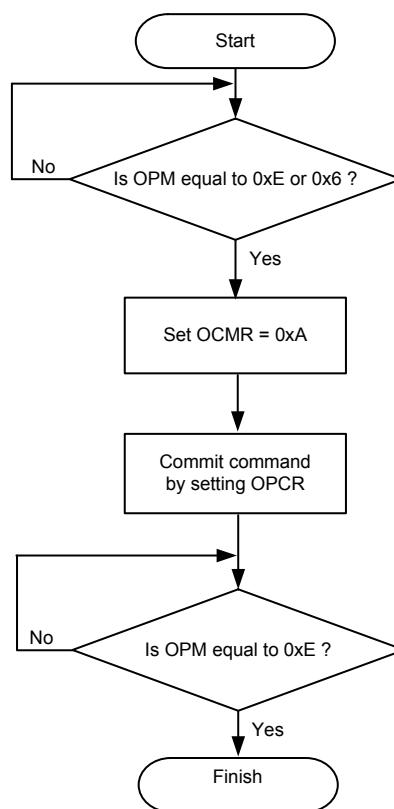

Figure 9. Mass Erase Operation Flowchart

Word Programming

The FMC provides a 32 bits word programming function which is used for modifying the Flash memory content. The following steps show the sequence of register access for word programming.

- Check OPCR register to confirm that no Flash memory operation is in progress (OPM [3:0] equals to 0xE or 0x6). Otherwise, wait until the previous operation has been finished.
- Write word address to TADR register. Write data to WRDR register.
- Write word program command to OCMR register (Set CMD [3:0] = 0x4).
- Commit word program command to FMC by setting OPCR register (Set OPM [3:0] = 0xA).
- Wait until all operations have been finished by checking the value of OPCR register (OPM [3:0] equals to 0xE).
- Read and verify the Flash memory if required.

Note that the word programming operation can not be successively applied to the same address twice. Successive word programming operation to the same address must be separated by a page erase operation. Besides, the word program will be ignored on protected pages. When this occurs, the OREF bit will be set by the FMC and then a Flash Operation Error interrupt will be generated if the OREIEN bit in the OIER register is set. Software can check the PPEF bit in the OISR register to detect this condition in the interrupt handler. The following figure displays the word programming operation flow.

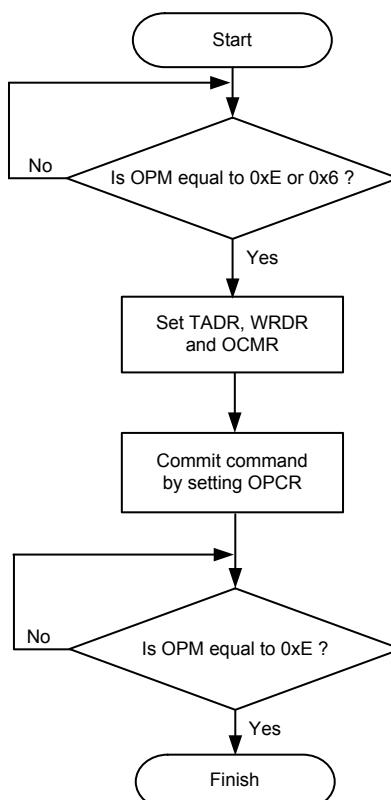

Figure 10. Word Programming Operation Flowchart

Option Byte Description

The Option Byte can be treated as an independent Flash memory of which base address is **0x1FF0_0000**. The following table shows the function description and Option Byte memory map.

Table 6. Option Byte Memory Map

Option Byte	Offset	Description	Reset Value
Option Byte Base Address = 0x1FF0_0000			
OB_PP	0x000 0x004 0x008 0x00C	Flash Page Erase / Program Protection (n = 0 ~ 127) OB_PP [n] (n = 0 ~ 30) 0: Flash Page n Erase / Program Protection is enabled 1: Flash Page n Erase / Program Protection is disabled OB_PP [n] (n = 31 ~ 127) Reserved	0xFFFF_FFFF 0xFFFF_FFFF 0xFFFF_FFFF 0xFFFF_FFFF
OB_CP	0x010	Flash Security Protection OB_CP [0] 0: Flash Security protection is enabled 1: Flash Security protection is disabled Option Byte Protection OB_CP [1] 0: Option Byte protection is enabled 1: Option Byte protection is disabled OB_CP [31:2] Reserved	0xFFFF_FFFF
OB_CK	0x020	Flash Option Byte Checksum OB_CK [31:0] OB_CK should be set as the content value sum of 5 registers which offset address is from 0x000 to 0x010 in Option Byte (0x000 + 0x004 + 0x008 + 0x00C + 0x010) when the OB_PP or OB_CP register's content is not equal to 0xFFFF_FFFF. Otherwise, both page erase / program protection and security protection will be enabled.	0xFFFF_FFFF

Page Erase / Program Protection

FMC provides functions of page erase / program protection to prevent unexpected operation of Flash memory. The page erase (CMD [3:0] = 0x8 in the OCMR register) or word programming (CMD [3:0] = 0x4) command will not be accepted by FMC on the protected pages. When the page erase or word programming command aimed at the protected pages is sent to the FMC, the PPEF bit in the OISR register will then be set by the FMC and the Flash operation error interrupt will be triggered to inform the CPU if the OREIEN bit in the OIER register is set. The page protection function can be enabled for each page independently by setting the OB_PP registers of the Option Byte. The following table shows the access permission of the main Flash page when the page protection is enabled.

Table 7. Access Permission of Protected Main Flash Page

Operation	Mode	ISP / IAP	ICP / Debug Mode
Read		O	O
Program		X	X
Page Erase		X	X
Mass Erase		O	O

- Notes:**
1. Note that the setting of write protection is based on page. The above access permission only affects the pages that enable protection function. Other pages are not affected.
 2. Main Flash page protection is configured by OB_PP [127:0]. Option Byte is physically located at the last page of main Flash Option Byte page protection is configured by the OB_CP [1] bit.
 3. The page erase on Option Byte area can disable the page protection of main Flash.
 4. The page protection of Option Byte can only be disabled by a mass erase operation.

The following steps show the register access sequence for page erase / program protection procedure.

- Check OPCR register to confirm that no Flash memory operation is in progress (OPM [3:0] equals to 0xE or 0x6). Otherwise, wait until the previous operation has been finished.
- Write OB_PP address to TADR register (TADR = 0x1FF0_0000).
- Write the data, which indicates the protection function of corresponding page is enabled or disabled, to the WRDR register (0: Enabled, 1: Disabled).
- Write word programming command to the OCMR register (Set CMD [3:0] = 0x4).
- Commit word programming command to FMC by setting the OPCR register (Set OPM [3:0] = 0xA).
- Wait until all operations have been finished by checking the value of the OPCR register (OPM [3:0] equals to 0xE).
- Read and verify the Option Byte if required.
- The OB_CK field in the Option Byte must be updated according to the Option Byte checksum rule.
- Apply a system reset to active the new OB_PP setting.

Security Protection

FMC provides a Security protection function to prevent illegal code / data access of the Flash memory. This function is useful for protecting the software / firmware from illegal users. The function is activated by setting the Option Byte OB_CP [0] bit. Once the function has been enabled, all the main Flash data access through ICP / Debug mode, programming and page erase will not be allowed except the user's application. But the mass erase operation will still be accepted by FMC in order to disable this function. The following table shows the access permission of Flash memory when the security protection is enabled.

Table 8. Access Permission When Security Protection is Enabled

Operation \ Mode	User Application ^(Note 1)	ICP / Debug Mode
Read	O	X (read as 0)
Program	O ^(Note 1)	X
Page Erase	O ^(Note 1)	X
Mass Erase	O	O

Notes: 1. User application means the software that is executed or booted from main Flash memory with the JTAG / SW debugger being disconnected. However, the Option Byte area and page 0 are still under protection where the Program / Page Erase operations are not accepted.
2. The Mass erase operation can erase the Option Byte area and disable the security protection.

The following steps show the register access sequence for Security protection procedure.

- Check the OPCR register to confirm that no Flash memory operation is in progress (OPM [3:0] equals to 0xE or 0x6). Otherwise, wait until the previous operation has been finished.
- Write OB_CP address to the TADR register (TADR = 0x1FF0_0010).
- Write the WRDR register to set the OB_CP [0] as 0.
- Write word programming command to the OCMR register (Set CMD [3:0] = 0x4).
- Commit word programming command to FMC by setting the OPCR register (Set OPM [3:0] = 0xA).
- Wait until all operations have been finished by checking the value of the OPCR register (OPM [3:0] equals to 0xE).
- Read and verify the Option Byte if required.
The OB_CK field in the Option Byte must be updated according to the Option Byte checksum rule.
- Apply a system reset to active the new OB_CP setting.

Register Map

The following table shows the FMC registers and reset values.

Table 9. FMC Register Map

Register	Offset	Description	Reset Value
TADR	0x000	Flash Target Address Register	0x0000_0000
WRDR	0x004	Flash Write Data Register	0x0000_0000
OCMR	0x00C	Flash Operation Command Register	0x0000_0000
OPCR	0x010	Flash Operation Control Register	0x0000_000C
OIER	0x014	Flash Operation Interrupt Enable Register	0x0000_0000
OISR	0x018	Flash Operation Interrupt and Status Register	0x0001_0000
PPSR	0x020	Flash Page Erase / Program Protection Status Register	0xFFFF_XXXX
	0x024		0xFFFF_XXXX
	0x028		0xFFFF_XXXX
	0x02C		0xFFFF_XXXX
CPSR	0x030	Flash Security Protection Status Register	0x0000_000X
VMCR	0x100	Flash Vector Mapping Control Register	0x0000_000X
MDID	0x180	Flash Manufacturer and Device ID Register	0x0376_XXXX
PNSR	0x184	Flash Page Number Status Register	0x0000_00XX
PSSR	0x188	Flash Page Size Status Register	0x0000_0400
DIDR	0x18C	Device ID Register	0x000X_XXXX
CIDR0	0x310	Custom ID Register 0	0xFFFF_XXXX
CIDR1	0x314	Custom ID Register 1	0xFFFF_XXXX
CIDR2	0x318	Custom ID Register 2	0xFFFF_XXXX
CIDR3	0x31C	Custom ID Register 3	0xFFFF_XXXX

Note: “X” means various reset values which depend on the Device, Flash value, option byte value or power on reset setting.

Register Descriptions

Flash Target Address Register – TADR

This register specifies the target address of the page erase and word programming operation.

Offset: 0x000

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24
TADB								
Type/Reset	RW	0						
23 22 21 20 19 18 17 16								
TADB								
Type/Reset	RW	0						
15 14 13 12 11 10 9 8								
TADB								
Type/Reset	RW	0						
7 6 5 4 3 2 1 0								
TADB								
Type/Reset	RW	0						

Bits	Field	Descriptions
[31:0]	TADB	<p>Flash Target Address Bits</p> <p>For programming operations, the TADR register specifies the address where the data is written. Since the programming length is 32 bits, the TADR shall be set as word-aligned (4 bytes). The TADB [1:0] will be ignored during programming operations. For page erase operations, the TADR register contains the page address which is going to be erased. Since the page size is 1 KB, the TADB [9:0] will be ignored in order to limit the target address as 1 Kbyte-aligned. For 32 KB main Flash addressing, TADB [31:15] should be zero and TADB [31:14] should be zero for 16 KB. Address from 0xFF0_0000 to 0xFF0_03FF is the 1 KB Option Byte. This field for available Flash address, it must be under 0xFFFF_FFFF. Otherwise, the Invalid Target Address interrupt will be occurred if the corresponding interrupt enable bit is set.</p>

Flash Write Data Register – WRDR

This register specifies the data to be written for programming operation.

Offset: 0x004

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24
WRDB								
Type/Reset	RW	0						
WRDB								
Type/Reset	RW	0						
WRDB								
Type/Reset	RW	0						
WRDB								
Type/Reset	RW	0						

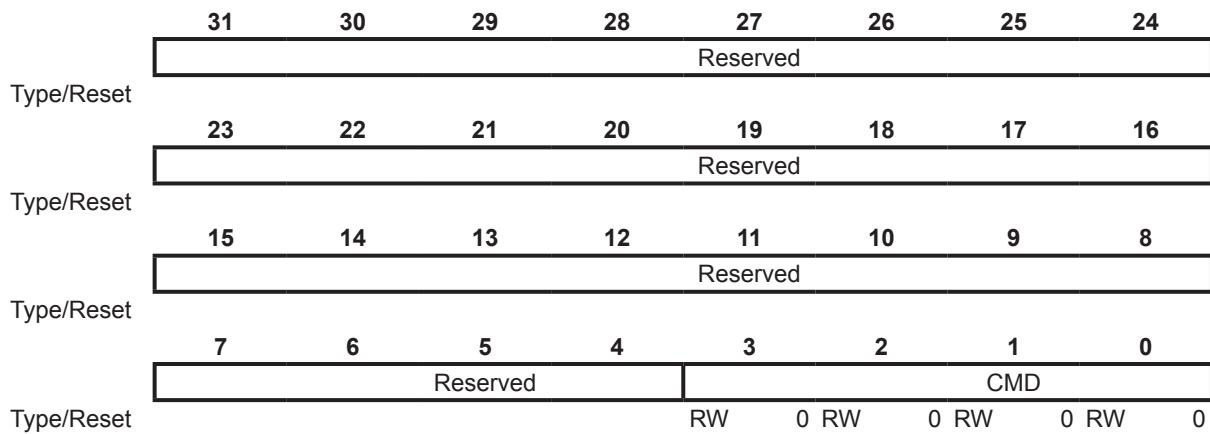

Bits	Field	Descriptions
[31:0]	WRDB	Flash Write Data Bits The data value for programming operation.

Flash Operation Command Register – OCMR

This register is used to specify the Flash operation commands that include word programming, page erase and mass erase.

Offset: 0x00C

Reset value: 0x0000_0000

Bits	Field	Descriptions												
[3:0]	CMD	<p>Flash Operation Command</p> <p>The following table shows definitions of CMD [3:0] bits which specify the Flash operation. If an invalid command is set and the IOCMIEN bit is set to 1, an Invalid Operation Command interrupt will occur.</p> <table border="1"> <thead> <tr> <th>CMD [3:0]</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0x0</td><td>Idle (default)</td></tr> <tr> <td>0x4</td><td>Word programming</td></tr> <tr> <td>0x8</td><td>Page erase</td></tr> <tr> <td>0xA</td><td>Mass erase</td></tr> <tr> <td>Others</td><td>Reserved</td></tr> </tbody> </table>	CMD [3:0]	Description	0x0	Idle (default)	0x4	Word programming	0x8	Page erase	0xA	Mass erase	Others	Reserved
CMD [3:0]	Description													
0x0	Idle (default)													
0x4	Word programming													
0x8	Page erase													
0xA	Mass erase													
Others	Reserved													

Flash Operation Control Register – OPCR

This register is used for controlling the command commitment and checking the status of the FMC operations.

Offset: 0x010

Reset value: 0x0000_000C

	31	30	29	28	27	26	25	24	
Type/Reset	Reserved

Type/Reset	Reserved			RW	0 RW	1 RW	1 RW	0	
					OPM				

Bits	Field	Descriptions										
[4:1]	OPM	<p>Operation Mode</p> <p>The following table shows the operation modes of the FMC. Users can commit command which is set by the OCMR register to the FMC according to the address alias setting in the TADR register. The contents of TADR, WRDR and OCMR registers shall be prepared before setting this register. After all the operation has been finished, the OPM field will be set as 0xE or 0xF by the FMC hardware. The Idle mode can be set when all the operations have been finished for power saving. Note that the operation status should be checked before the next action is applied to the FMC. The contents of TADR, WRDR, OCMR and OPCR registers should not be changed until the previous operation has been finished.</p>										
<table border="1"> <thead> <tr> <th>OPM [3:0]</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0x6</td> <td>Idle (default)</td> </tr> <tr> <td>0xA</td> <td>Commit command to main Flash</td> </tr> <tr> <td>0xE</td> <td>All operation finished on main Flash</td> </tr> <tr> <td>Others</td> <td>Reserved</td> </tr> </tbody> </table>			OPM [3:0]	Description	0x6	Idle (default)	0xA	Commit command to main Flash	0xE	All operation finished on main Flash	Others	Reserved
OPM [3:0]	Description											
0x6	Idle (default)											
0xA	Commit command to main Flash											
0xE	All operation finished on main Flash											
Others	Reserved											

Flash Operation Interrupt Enable Register – OIER

This register is used to enable or disable interrupt function of FMC. The FMC will generate interrupts when the corresponding interrupt enable bit is set and the interrupt condition occurs.

Offset: 0x014

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24
Type/Reset	Reserved							
	23	22	21	20	19	18	17	16

Type/Reset	Reserved							
	7	6	5	4	3	2	1	0
Type/Reset	Reserved		RW	0				

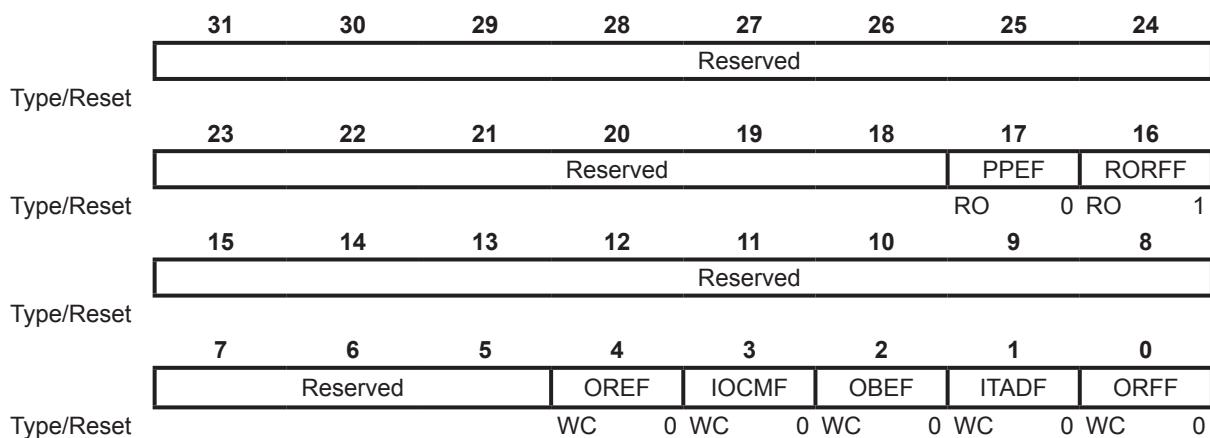

Bits	Field	Descriptions
[4]	OREIEN	Operation Error Interrupt Enable 0: Operation error interrupt is disabled 1: Operation error interrupt is enabled
[3]	IOCMIEN	Invalid Operation Command Interrupt Enable 0: Invalid Operation Command interrupt is disabled 1: Invalid Operation Command interrupt is enabled
[2]	OBEIEN	Option Byte Check Sum Error Interrupt Enable 0: Option Byte Check Sum Error interrupt is disabled 1: Option Byte Check Sum Error interrupt is enabled
[1]	ITADIEN	Invalid Target Address Interrupt Enable 0: Invalid Target Address interrupt is disabled 1: Invalid Target Address interrupt is enabled
[0]	ORFIEN	Operation Finished Interrupt Enable 0: Operation Finish interrupt is disabled 1: Operation Finish interrupt is enabled

Flash Operation Interrupt and Status Register – OISR

This register indicates the status of the FMC interrupt to check if an operation has been finished or an error occurs. The status bits, bit [4:0], if set high, are available to trigger the interrupt when the corresponding enable bits in the OIER register are set high.

Offset: 0x018

Reset value: 0x0001_0000

Bits	Field	Descriptions
[17]	PPEF	Page Erase / Program Protected Error Flag 0: Page Erase / Program Protected Error does not occur 1: Operation error due to an invalid erase / program operation being applied to a protected page This bit is reset by hardware once a new flash operation command is committed.
[16]	RORFF	Raw Operation Finished Flag 0: The last flash operation command is not finished 1: The last flash operation command is finished The RORFF bit is directly connected to the Flash memory for debugging purpose.
[4]	OREF	Operation Error Flag 0: No flash operation error occurred 1: The last flash operation is failed This bit will be set when any Flash operation error, such as invalid command, program error and erase error, etc., occurs. The ORE interrupt occurs if the OREIEN bit in the OIER register is set. Reset this bit by writing 1.
[3]	IOCMF	Invalid Operation Command Flag 0: No invalid flash operation command was set 1: An invalid flash operation command has been written into the OCMR register This bit will be set high when an invalid flash operation command has been written into the OCMR register. The IOCM interrupt will occur if the IOCMIEN bit in the OIER register is set. Reset this bit by writing 1.

Bits	Field	Descriptions
[2]	OBEF	<p>Option Byte Check Sum Error Flag</p> <p>0: Check sum of Option Byte is correct 1: Check sum of Option Byte is incorrect</p> <p>This bit will be set high when the Option Byte checksum is incorrect. The OBE interrupt will occur if the OBEIEN bit in the OIER register is set. This bit is cleared to 0 by software writing 1 into it. However, the Option Byte Checksum Error Flag can not be cleared by software until the interrupt condition is cleared, which means that the Option Byte check sum value has to be correctly modified or the corresponding interrupt control is disabled. Otherwise, the interrupt will be continually generated.</p>
[1]	ITADF	<p>Invalid Target Address Flag</p> <p>0: The target address is valid 1: The target address is invalid</p> <p>The data in the TADR field must be in the range from 0x0000_0000 to 0x1FFF_FFFF. Otherwise, this bit will be set high and an ITAD interrupt will be generated if the ITADIEN bit in the OIER register is set. Reset this bit by writing 1.</p>
[0]	ORFF	<p>Operation Finished Flag</p> <p>0: Operation is not finished 1: Last flash operation command is finished</p> <p>This bit will be set high when the last flash operation is finished. The ORF interrupt will be generated if the ORFIEN bit in the OIER register is set. Reset this bit by writing 1.</p>

Flash Page Erase / Program Protection Status Register – PPSR

This register indicates the status of Flash page erase / program protection.

Offset: 0x020 (0) ~ 0x02C (3)

Reset value: 0xFFFF_FFFF

	31	30	29	28	27	26	25	24
PPSBn								
Type/Reset	RO	X						
23 22 21 20 19 18 17 16								
PPSBn								
Type/Reset	RO	X						
15 14 13 12 11 10 9 8								
PPSBn								
Type/Reset	RO	X						
7 6 5 4 3 2 1 0								
PPSBn								
Type/Reset	RO	X						

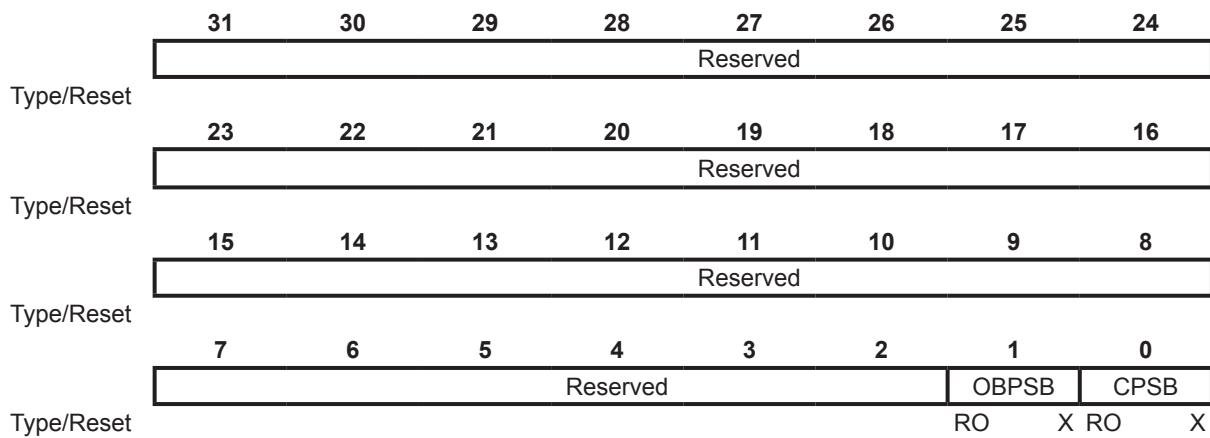

Bits	Field	Descriptions
[127:0]	PPSBn	<p>Page Erase / Program Protection Status Bits (n = 0 ~ 127) $\text{PPSB}[n] = \text{OB_PP}[n]$</p> <p>0: The corresponding page is protected 1: The corresponding page is not protected</p> <p>The content of this register is not dynamically updated and will only be reloaded from the Option Byte when any kind of reset occurs. The erase or program function of specific pages is not allowed when the corresponding bits of the PPSR registers are reset. The reset value of PPSR [127:0] is determined by the Option Byte OB_PP [127:0]. Since the maximum page number of the main flash is various and dependent on the chip specification. Therefore, the every page erase / program protection status bit may protect one or two pages and dependent on the chip specification. The other remained bits of OB_PP and PPSR registers are reserved.</p>

Flash Security Protection Status Register – CPSR

This register indicates the status of the Flash Memory Security protection. The content of this register is not dynamically updated and will only be reloaded by the Option Byte loader, which is active when any kind of reset occurs.

Offset: 0x030

Reset value: 0x0000_000X

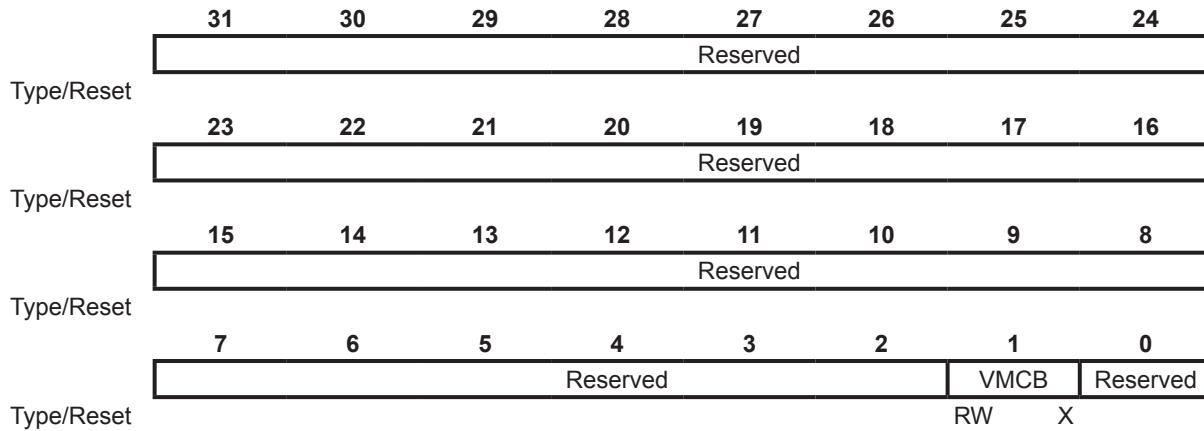

Bits	Field	Descriptions
[1]	OBPSB	Option Byte Page Erase / Program Protection Status Bit 0: The Option Byte page is protected 1: The Option Byte page is not protected The reset value of OBPSB is determined by the Option Byte, OB_CP [1].
[0]	CPSB	Flash Security Protection Status Bit 0: Flash Security protection is enabled 1: Flash Security protection is not enabled The reset value of CPSB is determined by the Option Byte, OB_CP [0].

Flash Vector Mapping Control Register – VMCR

This register is used to control the vector mapping. The reset value of the VMCR register is determined by the external booting pin, BOOT, during the power-on reset period.

Offset: 0x100

Reset value: 0x0000_000X

Bits	Field	Descriptions									
[1]	VMCB	Vector Mapping Control Bit The VMCB bits is used to control the mapping source of first 4-word vector (address 0x0 ~ 0xC). The following table shows the vector mapping setting.									
<table border="1"> <thead> <tr> <th>BOOT</th><th>VMCB</th><th>Descriptions</th></tr> </thead> <tbody> <tr> <td>Low</td><td>0</td><td> Boot Loader mode The vector mapping source is the boot loader area. </td></tr> <tr> <td>High</td><td>1</td><td> Main Flash mode The vector mapping source is the main Flash area. </td></tr> </tbody> </table>			BOOT	VMCB	Descriptions	Low	0	Boot Loader mode The vector mapping source is the boot loader area.	High	1	Main Flash mode The vector mapping source is the main Flash area.
BOOT	VMCB	Descriptions									
Low	0	Boot Loader mode The vector mapping source is the boot loader area.									
High	1	Main Flash mode The vector mapping source is the main Flash area.									

The reset value of VMCR is determined by the pins status of BOOT during power-on reset and system reset. The vector mapping setting can be changed temporarily by setting the VMCB bit when the application is running.

Flash Manufacturer and Device ID Register – MDID

This register specifies the manufacture ID and device part number information which can be used as the product identity.

Offset: 0x180

Reset value: 0x0376_XXXX

	31	30	29	28	27	26	25	24
MFID								
Type/Reset	RO	0 RO	1 RO

PSSB								
Type/Reset	RO	0						

Bits	Field	Descriptions
[31:0]	PSSB	Status Bits of Flash Page Size 0x200: That means the page size is 512 Byte per page 0x400: That means the page size is 1 KB per page 0x800: That means the page size is 2 KB per page

Device ID Register – DIDR

This register specifies the device part number information which can be used as the product identity.

Offset: 0x18C

Reset value: 0x000X_XXXX

Bits	Field	Descriptions
[19:0]	ChipID	Chip ID Read the complete 5 digital codes of the MCU device part number.

Custom ID Register n – CIDRn, n = 0 ~3

This register specifies the custom ID information which can be used as the custom identity.

Offset: 0x310 (0) ~ 0x31C (3)

Reset value: Various depending on Flash Manufacture Privilege Information Block.

	31	30	29	28	27	26	25	24
Type/Reset	RO	X RO	X RO	X RO	X RO	X RO	X RO	X

Bits	Field	Descriptions
[31:0]	CIDn	Custom ID Read as the CIDn[31:0] (n=0 ~ 3) field in the Custom ID registers in Flash Manufacture Privilege Block.

5 Power Control Unit (PWRCU)

Introduction

The power consumption can be regarded as one of the most important issues for many embedded system applications. Accordingly the Power Control Unit, PWRCU, provides many types of power saving modes such as Sleep, Deep-Sleep1 and Deep-Sleep2 modes. These modes reduce the power consumption and allow the application to achieve the best trade-off between the conflicting demands of CPU operating time, speed and power consumption. The dash line in the Figure 11 indicates the power supply source of two digital power domains.

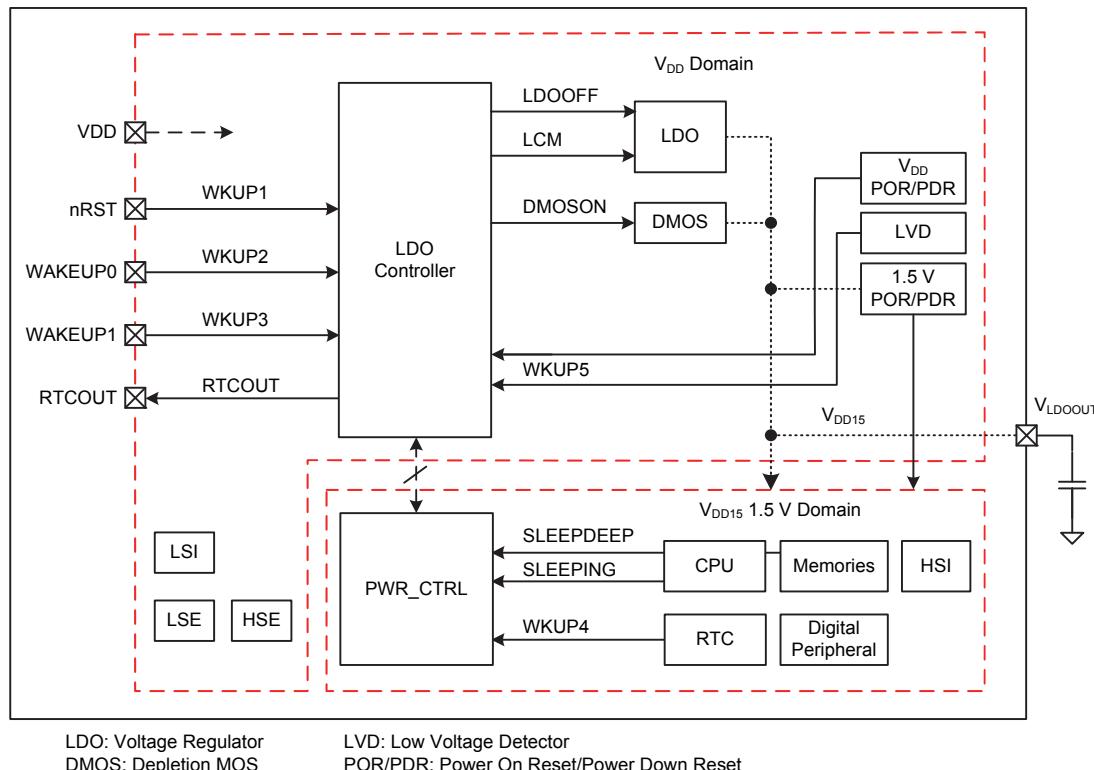

Figure 11. PWRCU Block Diagram

Features

- Three power domains: V_{DD} , V_{DDIO} and V_{DDIS} 1.5 V power domains.
- Three power saving modes: Sleep, Deep-Sleep1 and Deep-Sleep2 modes.
- Internal Voltage regulator supplies 1.5 V voltage source.
- Additional Depletion MOS supplies 1.5 V voltage source with low leakage and low operating current.
- A power reset is generated when one of the following events occurs:
 - Power-on / Power-down reset (POR / PDR reset).
 - The control bits BODEN = 1, BODRIS=0 and the supply power $V_{DD} \leq V_{BOD}$.
- BOD Brown-out Detector can issue a system reset or an interrupt when V_{DD} power source is lower than the Brown Out Detector voltage V_{BOD} .
- LVD Low Voltage Detector can issue an interrupt or wakeup event when V_{DD} is lower than a programmable threshold voltage V_{LVD} .

Functional Descriptions

V_{DD} Power Domain

LDO Power Control

The LDO will be automatically switched off when the following condition occurs:

- The Deep-Sleep2 mode is entered.

The LDO will be automatically switched on by hardware when the supply power $V_{DD} > V_{POR}$ if any of the following conditions occurs:

- Resume operation from the power saving mode – RTC wakeup, LVD wakeup, EXTI wakeup and WAKEUP pins.
- Detect a falling edge on the external reset pin (nRST).
- The control bit BODEN = 1 and the supply power $V_{DD} > V_{BOD}$.

To enter the Deep-Sleep1 mode, the PWRCU will request the LDO to operate in a low current mode, LCM. To enter the Deep-Sleep2 mode, the PWRCU will turn off the LDO and turn on the DMOS to supply an alternative 1.5 V power.

Voltage Regulator

The voltage regulator, LDO, Depletion MOS, DMOS, Low voltage Detector, LVD, Low Speed Internal RC oscillator, LSI, Low Speed External Crystal oscillator, LSE, and the High Speed External Crystal oscillator, HSE, are operated under the V_{DD} power domain. The LDO can be configured to operate in either normal mode (LDOOFF = 0, LDOLCM = 0, I_{OUT} = High current mode) or low current mode (LDOOFF = 0, LDOLCM =1, I_{OUT} = Low current mode) to supply the 1.5 V power. An alternative 1.5 V power source is the output of the DMOS which has low static and driving current characteristics. It is controlled using the DMOSON bit in the PWRCR register. The DMOS output has weak output current and regulation capability and only operates in the Deep-Sleep2 mode for data retention purposes in the V_{DDIS} power domain.

Power On Reset (POR) / Power Down Reset (PDR)

The device has an integrated POR / PDR circuitry that allows proper operation starting from V_{POR} . For more details concerning the power on / power down reset threshold voltage, refer to the electrical characteristics of the corresponding datasheet.

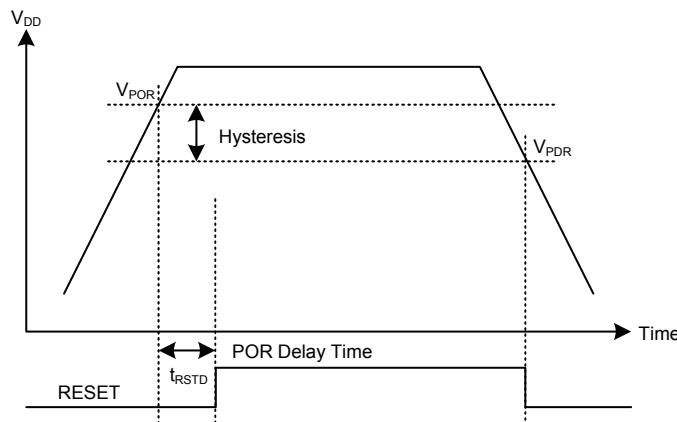

Figure 12. Power On Reset / Power Down Reset Waveform

Low Voltage Detector / Brown Out Detector

The Low Voltage Detector, LVD, can detect whether the supply voltage V_{DD} is lower than a programmable threshold voltage V_{LVD} . It is selected by the LVDS bits in the LVDCSR register. When a low voltage on the V_{DD} power pin is detected, the LVDF flag will be active and an interrupt will be generated and sent to the MCU core if the LVDEN and LVDIWEN bits in the LVDCSR register are set. For more details concerning the LVD programmable threshold voltage V_{LVD} , refer to the electrical characteristics of the corresponding datasheet.

The Brown Out Detector, BOD, is used to detect if the V_{DD} supply voltage is equal to or lower than V_{BOD} . When the BODEN bit in the LVDCSR register is set to 1 and the V_{DD} supply voltage is lower than V_{BOD} then the BODF flag is active. The PWRCU will regard this as a power down reset situation and then immediately issue a system reset when the BODRIS bit is cleared to 0 or issue an interrupt to notify the CPU to execute a power down procedure when the BODRIS bit is set to 1. For more details concerning the Brown Out Detector voltage V_{BOD} , refer to the electrical characteristics of the corresponding datasheet.

High Speed External Oscillator

The High Speed External Oscillator, HSE, is located in the V_{DD} power domain. The HSE crystal oscillator can be switched on or off using the HSEEN bit in the Global Clock Control Register (GCCR). The HSE clock can be used directly as the system clock source.

LSE, LSI and RTC

The Real Time Clock Timer clock source can be derived from either the Low Speed Internal RC oscillator, LSI, or the Low Speed External Crystal oscillator, LSE. Before entering the power saving mode by executing WFI / WFE instruction, the MCU needs to setup the compare register with an expected wakeup time and enable the wakeup function to achieve the RTC timer wakeup event. After entering the power saving mode for a certain amount of time, the Compare Match flag, CMFLAG, will be asserted to wake up the device when the compare match event occurs. The details of the RTC configuration for wakeup timer will be described in the RTC chapter.

1.5 V Power Domain

The main functions that include high speed internal oscillator, HSI, MCU core logic, AHB / APB peripherals and memories and so on are located in this power domain. Once the 1.5 V is powered up, the POR will generate a reset sequence on 1.5 V power domain. Subsequently, to enter the expected power saving mode, the associated control bits including the LDOOFF, DMOSON and LDOLCM bits must be configured. Then, once a WFI or WFE instruction is executed, the device will enter an expected power saving mode which will be discussed in the following section.

High Speed Internal Oscillator

The High Speed Internal Oscillator, HSI, is located in the V_{DD15} power domain. When exiting from the Deep-Sleep mode, the HSI clock will be configured as the system clock for a certain period by setting the PSRCEN bit to 1. This bit is located in the Global Clock Control Register, GCCR, in the Clock Control Unit, CKCU. The system clock will not be switched back to the original clock source used before entering the Deep-Sleep mode until the original clock source stabilizes.

Operation Modes

Run Mode

In the Run mode, the system operates with full functions and all power domains are active. There are two ways to reduce the power consumption in this mode. The first is to slow down the system clock by setting the AHBPRE field in the CKCU AHBCFGR register, and the second is to turn off the unused peripherals clock by setting the APBCCR0 and APBCCR1 registers or slow down peripherals clock by setting the APBPCSR0 and APBPCSR1 registers to meet the application requirement. Reducing the system clock speed before entering the sleep mode will also help to minimize power consumption.

Additionally, there are several power saving modes to provide maximum optimization between device performance and power consumption.

Table 10. Operation Mode Definitions

Mode Name	Hardware Action
Run	After system reset, CPU fetches instructions to execute.
Sleep	1. CPU clock will be stopped. 2. Peripherals, Flash and SRAM clocks can be stopped by setting.
Deep-Sleep1~2	1. Stop all clocks in the 1.5 V power domain. 2. Disable HSI, HSE. 3. Turning on the LDO low current mode or DMOS to reduce the 1.5 V power domain current.

Sleep Mode

By default, only the CPU clock will be stopped in the Sleep mode. Clearing the FMCEN or SRAMEN bit in the CKCU AHBCCR register to 0 will have the effect of stopping the Flash clock or SRAM clock after the system enters the Sleep mode. If it is not necessary for the CPU to access the Flash memory and SRAM in the Sleep mode, it is recommended to clear the FMCEN and SRAMEN bits in the AHBCCR register to minimize power consumption. To enter the Sleep mode, it is only CPU executes a WFI or WFE instruction and lets the SLEEPDEEP signal to 0. The system will exit from the Sleep mode via any interrupt or event trigger. The accompanying table provides more information about the power saving modes.

Table 11. Enter / Exit Power Saving Modes

Mode	Mode Entry				Mode Exit
	CPU Instruction	CPU SLEEPDEEP	LDOOFF	DMOSON	
Sleep		0	X	X	WFI: Any interrupt WFE: Any wakeup event ⁽¹⁾ or Any interrupt (NVIC on) or Any interrupt with SEVONPEND = 1 (NVIC off)
Deep-Sleep1	WFI or WFE (Takes effect)	1	0	0	Any EXTI in event mode or RTC wakeup or LVD wakeup ⁽²⁾ or WAKEUP pins
Deep-Sleep2		1	X	1	Any EXTI in event mode or RTC wakeup or LVD wakeup ⁽²⁾ or WAKEUP pins

Notes: 1. Wakeup event means EXTI line in event mode, RTC, LVD and WAKEUP pins

2. If the system allows the LVD activity to wake it up after the system has entered the power saving mode, the LVDEWEN and LVDEN bits in the LVDCSR register must be set to 1 to make sure that the system can be woken up by an LVD event and then the LDO regulator can be turned on when system is woken up from the Deep-Sleep2 mode.

Deep-Sleep Mode

To enter Deep-Sleep mode, configure the registers as shown in the preceding table and execute the WFI or WFE instruction. In the Deep-Sleep mode, all clocks including high speed oscillator, known as HSI and HSE, will be stopped. In addition, Deep-Sleep1 turns the LDO into low current mode while Deep-Sleep2 turns off the LDO and uses a DMOS to keep 1.5 V power. Once the PWRCU receives a wakeup event or an interrupt as shown in the preceding Mode-Exiting table, the LDO will then operate in normal mode and the high speed oscillator will be enabled. Finally, the CPU will return to Run mode to handle the wakeup interrupt if required. A Low Voltage Detection also can be regarded as a wakeup event if the corresponding wakeup control bit LVDEWEN in the LVDCSR register is enabled. The last wakeup event is a transition on the external WAKEUP pin sent to the PWRCU to resume from Deep-Sleep mode. During the Deep-Sleep mode, retaining the register and memory contents will shorten the wakeup latency.

Table 12. Power Status After System Reset

PORF	PORSTF	Description
1	1	Power-up for the first time after the V _{DD} power domain is reset: Power on reset when V _{DD} is applied for the first time or executing software reset command on the V _{DD} domain.
0	1	Restart from unexpected loss of the 1.5 V power or other reset (nRST, WDT, ...)

Register Map

The following table shows the PWRCU registers and reset values. Note all the registers in this unit are located in the V_{DD15} power domain.

Table 13. PWRCU Register Map

Register	Offset	Description	Reset Value

6 Clock Control Unit (CKCU)

Introduction

The Clock Control unit, CKCU, provides functions of high speed internal RC oscillator, HSI, High speed external crystal oscillator, HSE, Low speed internal RC oscillator, LSI, Low speed external crystal oscillator, LSE, HSE clock monitor, clock prescaler, clock multiplexer and clock gating. The clock of AHB, APB and CPU are derived from system clock, CK_SYS, which can come from HSI, HSE, LSI and LSE. Watchdog Timer and Real Time Clock, RTC, use either LSI or LSE as their clock source.

A variety of internal clocks can also be wired out through CKOUT for debugging purpose. The clock monitor can be used to get clock failure detection of HSE. Once the clock of HSE does not function (could be broken down or removed or etc.), CKCU will force to switch the system clock source to HSI clock to prevent system halt.

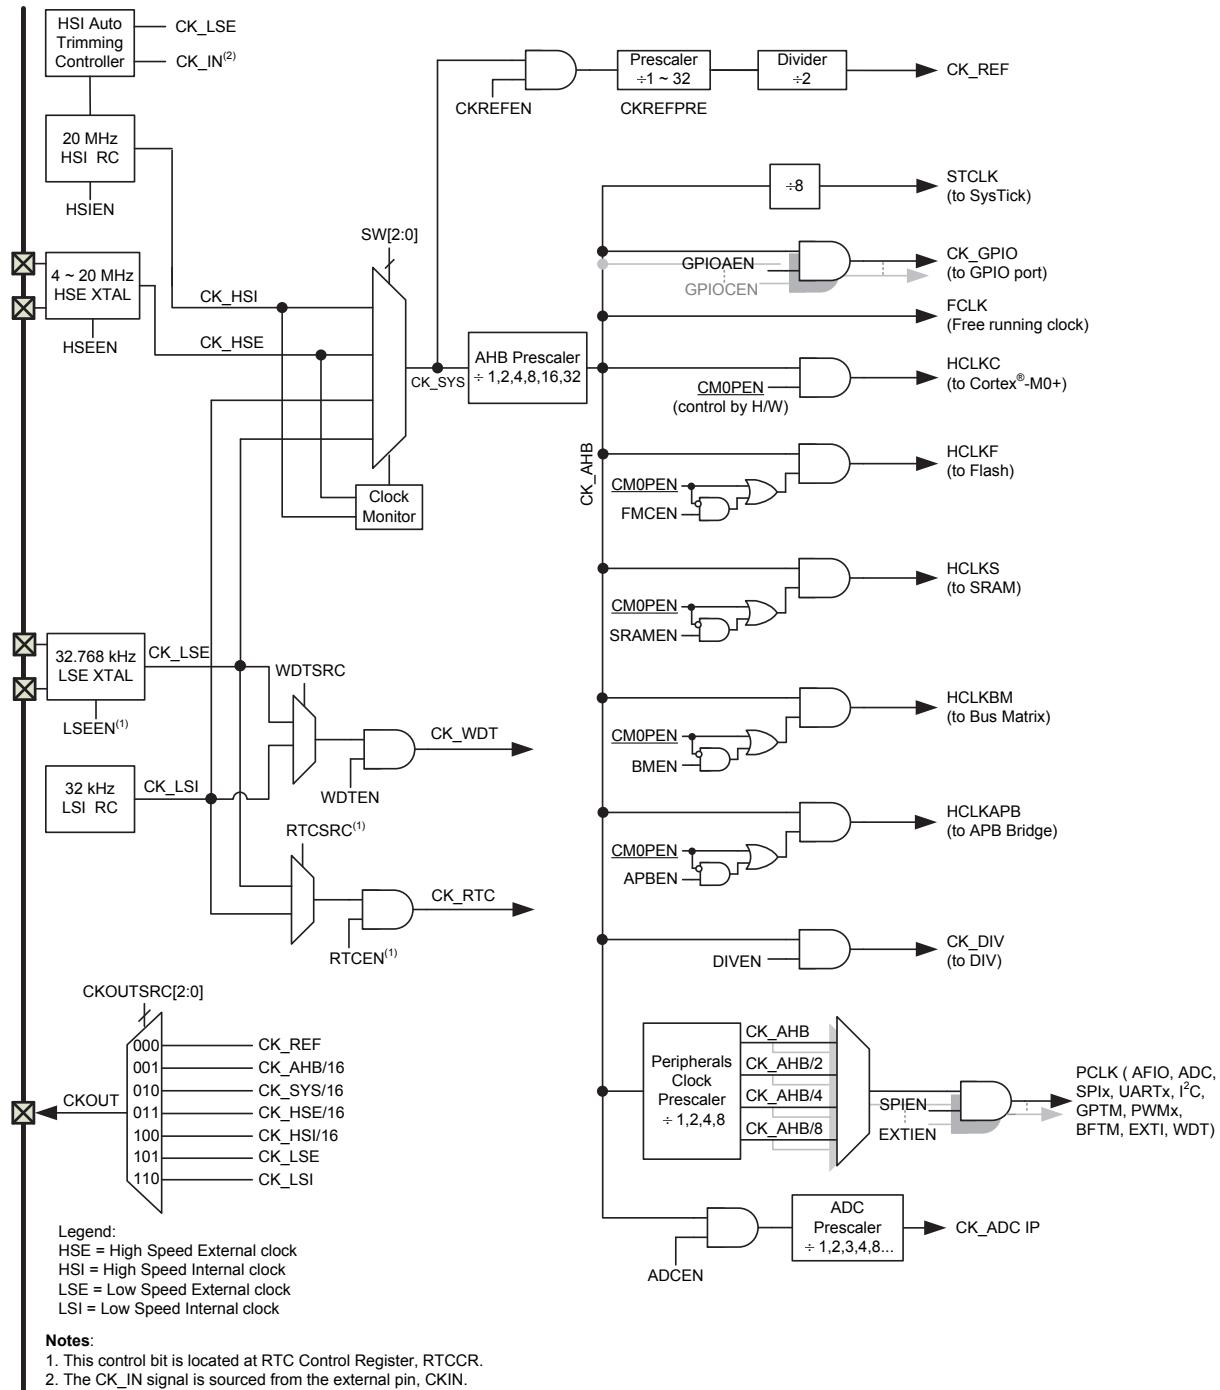

Figure 13. CKCU Block Diagram

Features

- 4 ~ 20 MHz external crystal oscillator (HSE)
- Internal 20 MHz RC oscillator (HSI) with configuration option calibration and custom trimming capability.
- 32,768 Hz external crystal oscillator (LSE) for Watchdog Timer, RTC or system clock.
- Internal 32 kHz RC oscillator (LSI) for Watchdog Timer, RTC or system clock.
- HSE clock monitor

Function Descriptions

High Speed External Crystal Oscillator – HSE

The high speed external 4 to 20 MHz crystal oscillator (HSE) produces a highly accurate clock source to the system clock. The related hardware configuration is shown in the following figure. The crystal with specific frequency must be placed across the two HSE pins (XTALIN / XTALOUT) and the external components such as resistors and capacitors are necessary to make it oscillate properly.

The following guidelines are provided to improve the stability of the crystal circuit PCB layout.

- The crystal oscillator should be located as close as possible to the MCU so that the trace lengths are kept as short as possible to reduce any parasitic capacitances.
- Shield any lines in the vicinity of the crystal by using a ground plane to isolate signals and reduce noise.
- Keep frequently switching signal lines away from the crystal area to prevent crosstalk.

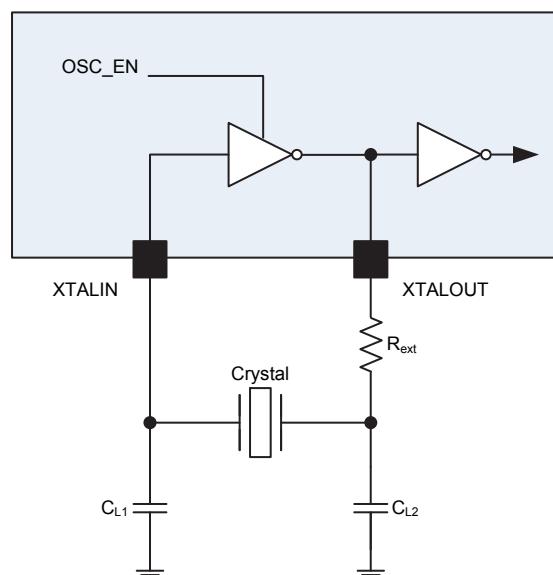

Figure 14. External Crystal, Ceramic and Resonators for HSE

The HSE crystal oscillator can be switched on or off using the HSEEN bit in the Global Clock Control Register (GCCR). The HSERDY flag in the Global Clock Status Register (GCSR) will indicate if the high-speed external crystal oscillator is stable. While switching on the HSE, the HSE clock will still not be released until this HSERDY bit is set by the hardware. The specific delay period is well-known as “Start-up time”. The HSE clock can then be used directly as the system clock source.

High Speed Internal RC Oscillator – HSI

The high speed internal RC oscillator (HSI) is the default selection of clock source for the CPU when the device is powered up. The HSI RC oscillator provides a clock source in a lower cost because no external components are required. The HSI RC oscillator can be switched on or off using the HSIEN bit in the Global Clock Control Register (GCCR). The HSIRDY flag in the Global Clock Status Register (GCSR) will indicate if the internal RC oscillator is stable. The start-up time of HSI is shorter than the HSE crystal oscillator.

The accuracy of the frequency of the high speed internal RC oscillator HSI can be calibrated via the configuration options, but it is still less accurate than the HSE crystal oscillator. The applications, the environments and the cost will determine the use of the oscillators.

Software could configure the PSRCEN bit (Power Saving Wakeup RC Clock Enable) to 1 to force HSI clock to be system clock when wake-up from Deep-Sleep1/2 mode. Subsequently, the system clock is back to the original clock source if the original clock source ready flag is asserted. This function can reduce the wakeup time when using HSE as system clock.

Auto Trimming of High Speed Internal RC Oscillator – HSI

The frequency accuracy of the high speed internal RC oscillator HSI can vary from one chip to another due to manufacturing process variations, this is why each device is factory calibrated by HOLTEK for $\pm 2\%$ accuracy at $V_{DD} = 5\text{ V}$ and $T_A = 25^\circ\text{C}$. But the accuracy is not enough for some applications and environments requirement. Therefore, this device provides the trimming mechanism for HSI frequency calibration using more accurate external reference clock. The detailed block diagram is shown as Figure 15.

After reset, the factory trimming value is loaded in the HSICOARSE[4:0] and HSIFINE[7:0] bits in the HSI Control Register (HSICR). The HSI frequency accuracy may be affected by voltage or temperature variations. If the application has to be driven by a more accurate HSI frequency, users can trim manually the HSI frequency using the HSIFINE[7:0] bits in the HSI Control Register (HSICR) or automatically adjust the HSI frequency using the Auto Trimming Controller (ATC) together with an external reference clock in the application. The reference clock can be provided from the following clock sources:

- 32,768 Hz low speed external crystal or ceramic resonator oscillator LSE output clock
- External pin (CKIN) with 1 kHz pulse

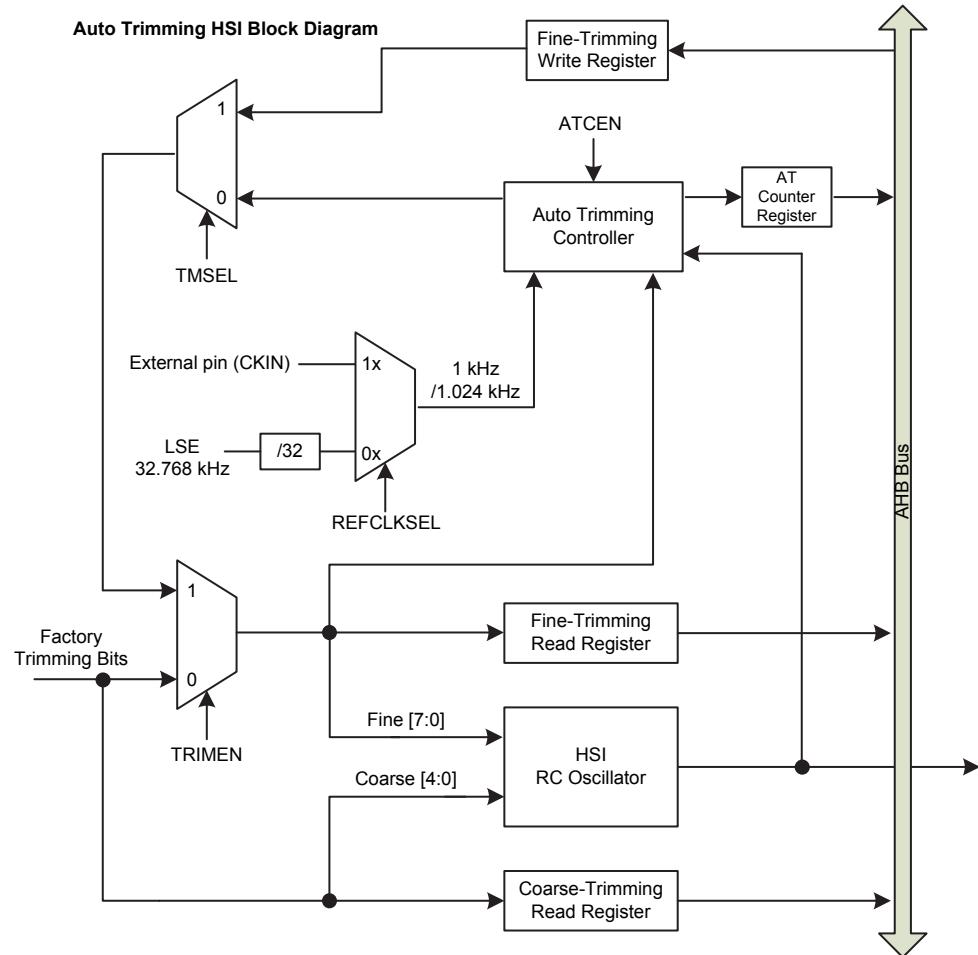

Figure 15. HSI Auto Trimming Block Diagram

Low Speed External Crystal Oscillator – LSE

The low speed external crystal or ceramic resonator oscillator with 32.768 kHz frequency produces a low power but highly accurate clock source for the circuits of Real-Time-Clock peripheral, Watchdog Timer or system clock. The associated hardware configuration is shown in the following figure. The crystal or ceramic resonator must be placed across the two LSE pins (X32KIN / X32KOUT) and the external capacitors are necessary to make it oscillate properly. The LSE oscillator can be switched on or off by using the LSEEN bit in the RTC Control Register (RTCCR). The LSERDY flag in the Global Clock Status Register (GCSR) will indicate if the LSE clock is stable.

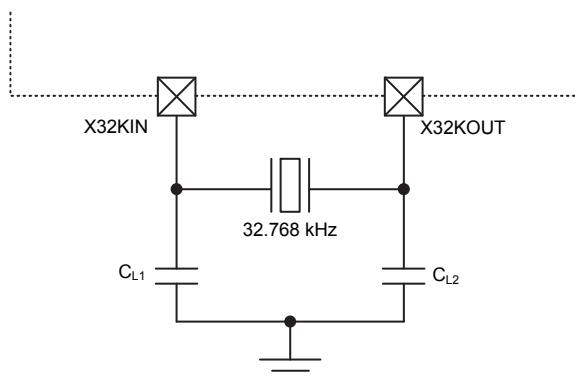

Figure 16. External Crystal, Ceramic and Resonators for LSE

Low Speed Internal RC Oscillator – LSI

The low speed internal RC oscillator with frequency of about 32 kHz produces a low power clock source for the circuits of Real-Time-Clock peripheral, Watchdog Timer or system clock. The LSI is also a clock source of low cost because no external component is needed to make it oscillates. The accuracy of the frequency of the low speed internal RC oscillator LSI is shown as the corresponding data sheet. The LSIRDY flag in the Global Clock Status Register (GCSR) will indicate if the LSI clock is stable.

Clock Ready Flag

CKCU provides clock ready flags for HSI, HSE, LSI and LSE to confirm those clocks are stable before using them as system clock source or other purpose. Software can check specific clock is ready or not by polling separate clock ready status bits in GCSR register.

System Clock (CK_SYS) Selection

After the system reset occurs, the default system clock source CK_SYS will be the high speed internal RC oscillator HSI. The CK_SYS may come from the HSI, HSE, LSI and LSE output clock and it can be switched from one clock source to another via the System Clock Switch bits, SW, in the Global Clock Control Register GCCR. The system will still run under the original clock until the destination clock gets ready. The corresponding clock ready status bits in the Global Clock Status Register GCSR will indicate whether the selected clock is ready to use or not. The CKCU also contains the clock source status bits in the Clock Source Status Register CKST to indicate which clock is currently used as the system clock. More details about function of clock enable are described in below.

If any following action takes effect, the HSI is always under enable state.

- Enable Clock monitor. (CKMEN)
- Configure clock switch register bits to select the HSI. (SW)
- Configure HSI enable register bit to 1. (HSIEN)

If any following action takes effect, the HSE is always under enable state.

- Configure clock switch register bits to select the HSE. (SW)
- Configure HSE enable register bit to 1. (HSEEN)

Programming guide of System clock selection is listed in following.

1. Enable any source clock which will become system clock.
2. Configuring the SW register bits to change system clock source will take effect after ready flag of source clock is asserted. Note that system clock will force to HSI if clock monitor is enabled and HSE clock configured as system clock is stuck at 0 or 1.

HSE Clock Monitor

The main function of the oscillator check is enabled by the HSE Clock Monitor Enable bit CKMEN in the Global Clock Control Register, GCCR. The HSE clock monitor should be enabled after the HSE oscillator start-up delay and be disabled when the HSE oscillator is stopped. Once the HSE oscillator failure is detected, the HSE oscillator will automatically be disabled. The HSE clock stuck flag CKSF in the Global Clock Interrupt Register GCIR will be set and an event of main oscillator failure will be generated if the clock fail interrupt enable bit CKSIE in the GCIR is set. This failure interrupt is connected to the exception vector of CPU Non-Maskable Interrupt, NMI. If the HSE is directly used as the system clock, when the HSE oscillator failure occurs, the HSE will be turned off and the system clock will be switched to the HSI automatically by the hardware.

Clock Output Capability

The device has the clock output capability to allow the clocks to be output on the specific external output pin CKOUT. The configuration registers of the corresponding GPIO port must be well configured in the Alternate Function I/O section, AFIO, to output the selected clock signal. There are seven output clock signals to be selected via the device clock output source selection bits CKOUTSRC in the Global Clock Configuration Register, GCFGGR.

Table 14. CKOUT Clock Source

CKOUTSRC[2:0]	Clock Source
000	CK_REF = CK_SYS / (CKREFPRE + 1) / 2
001	CK_AHB / 16
010	CK_SYS / 16
011	CK_HSE / 16
100	CK_HSI / 16
101	CK_LSE
110	CK_LSI

Register Map

The following table shows the CKCU register and reset value.

Register Descriptions

Global Clock Configuration Register – GCFGR

This register specifies the low power mode status and clock source for CKOUT.

Offset: 0x000

Reset value: 0x0000_0002

Bits	Field	Descriptions
[31:29]	LPMOD	<p>Lower Power Mode Status</p> <p>000: When Chip is in running mode</p> <p>001: When Chip wants to enter Sleep mode</p> <p>010 :When Chip wants to enter Deep-Sleep1 mode</p> <p>011: When Chip wants to enter Deep-Sleep2 mode</p> <p>Others: Reserved</p> <p>Set and reset by hardware.</p>
[15:11]	CKREFPRE	<p>CK_REF Clock Prescaler Selection</p> $\text{CK_REF} = \text{CK_SYS} / (\text{CKREFPRE} + 1) / 2$ <p>00000: CK_REF = CK_SYS / 2</p> <p>00001: CK_REF = CK_SYS / 4</p> <p>...</p> <p>11111: CK_REF = CK_SYS / 64</p> <p>Set and reset by software to control CK_REF clock prescaler setting.</p>
[2:0]	CKOUTSRC	<p>CKOUT Clock Source Selection</p> <p>000: (CK_SYS / CKOUTPREG / 2) is selected</p> <p>001: (CK_AHB / 16) is selected</p> <p>010: (CK_SYS / 16) is selected</p> <p>011: (CK_HSE / 16) is selected</p> <p>100: (CK_HSI / 16) is selected</p> <p>101: CK_LSE is selected</p> <p>110: CK_LSI is selected</p> <p>111: Reserved</p> <p>Set and reset by software.</p>

Global Clock Control Register – GCCR

This register specifies the clock enable bits.

Offset: 0x004

Reset value: 0x0000_0803

Bits	Field	Descriptions
[17]	PSRCEN	<p>Power Saving Wakeup RC Clock Enable</p> <p>0: No action 1: Use Internal RC clock (HSI) as system clock after a Deep-Sleep1/2 mode wakeup</p> <p>Software can set PSRCEN to high before entering Deep-Sleep1/2 mode in order to reduce the waiting time after wakeup. When PSRCEN = 1, hardware will select HSI as clock source after the system wakeup from Deep-Sleep1/2 mode. Meanwhile, instruction can start execution since the HSI clock is provided to MCU. After the original clock source, which is selected as CK_SYS before entering Deep-Sleep1/2 mode, is ready, hardware will switch back the clock source as originally.</p>
[16]	CKMEN	<p>HSE Clock Monitor Enable</p> <p>0: Disable External crystal oscillator clock monitor 1: Enable External crystal oscillator clock monitor</p> <p>When hardware detects HSE clock stuck at low / high state, internal hardware will switch the system clock to internal high speed RC clock (HSI). The only way to recover the system clock is by an external reset, a power on reset or by clearing CKSF by software.</p>
[11]	HSIEN	<p>Internal High Speed Clock Enable</p> <p>0: Internal RC oscillator clock is set to off 1: Internal RC oscillator clock is set to on</p> <p>Set and reset by software. This bit can not be reset if HSI clock is used as system clock.</p>
[10]	HSEEN	<p>External High Speed Clock Enable</p> <p>0: External crystal oscillator clock is set to off 1: External crystal oscillator clock is set to on</p> <p>Set and reset by software. This bit can not be reset if the HSE clock is used as system clock.</p>

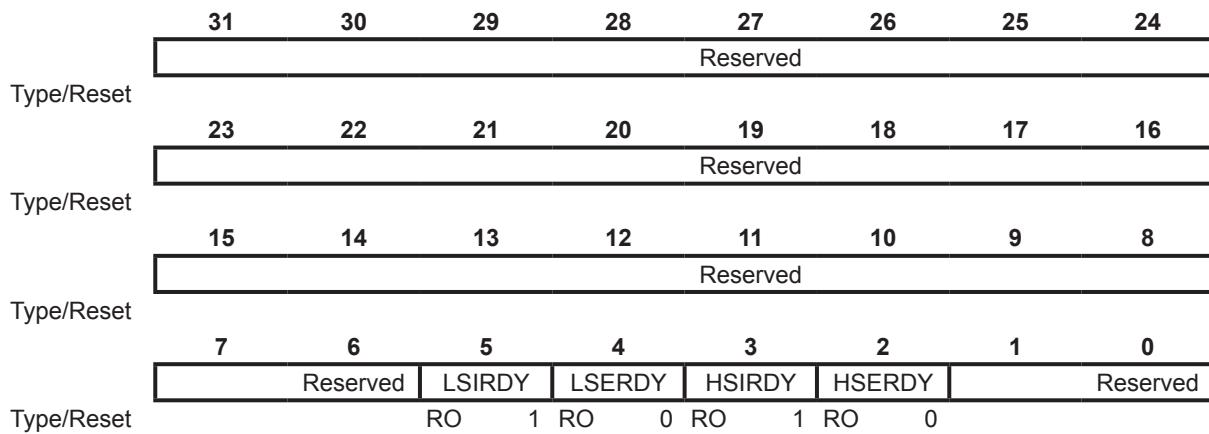

Bits	Field	Descriptions
[8]	HSEGAIN	External High Speed Clock Gain Selection 0: HSE low gain mode 1: HSE high gain mode
[2:0]	SW	System Clock Switch 010: CK_HSE as system clock 011: CK_HSI as system clock 110: CK_LSE as system clock 111: CK_LSI as system clock Others: CK_HSI as system clock These bits are set and reset by software to select CK_SYS source. If the HSE oscillator is used directly or indirectly as the system clock and the HSE clock monitor function is enabled, once the HSE failure is detected, these bits will be set by hardware to force HSI (b011) as the system clock. Note: When switch the system clock using the SW bits, the system clock is not immediately switched and a certain delay is necessary. The software can monitor the CKSWST bit in the clock source status register CKSTR to make sure which clock is currently used as system clock.

Global Clock Status Register – GCSR

This register indicates the clock ready status.

Offset: 0x008

Reset value: 0x0000_0028

Bits	Field	Descriptions
[5]	LSIRDY	Internal Low Speed Clock Ready Flag 0: Internal 32 kHz RC oscillator clock is not ready 1: Internal 32 kHz RC oscillator clock is ready Set by hardware to indicate that the LSI is stable to be used.
[4]	LSEIRDY	External Low Speed Clock Ready Flag 0: External 32.768 kHz RC oscillator clock is not ready 1: External 32.768 kHz RC oscillator clock is ready Set by hardware to indicate that the LSE is stable to be used.
[3]	HSIRDY	Internal High Speed Clock Ready Flag 0: Internal RC oscillator clock is not ready 1: Internal RC oscillator clock is ready Set by hardware to indicate that the HSI is stable to be used.
[2]	HSEIRDY	External High Speed Clock Ready Flag 0: External crystal oscillator clock is not ready 1: External crystal oscillator clock is ready Set by hardware to indicate that the HSE is stable to be used.

Global Clock Interrupt Register – GCIR

This register specifies interrupt enable and flag bits.

Offset: 0x00C

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24
Type/Reset						Reserved		
	23	22	21	20	19	18	17	16

Type/Reset							WC	0

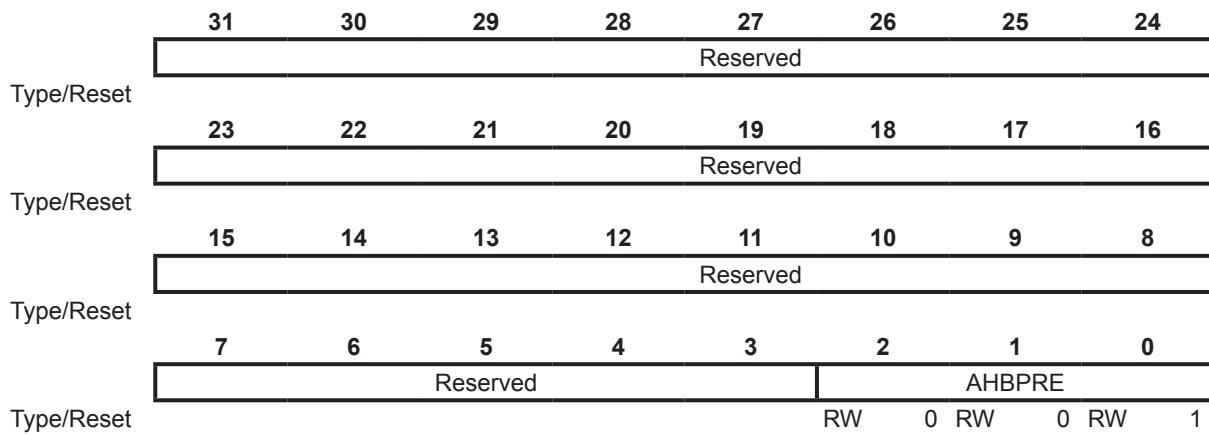

Bits	Field	Descriptions
[16]	CKSIE	Clock Stuck Interrupt Enable 0: Disable clock fail interrupt 1: Enable clock fail interrupt Set and reset by software to enable / disable interrupt caused by clock monitor.
[0]	CKSF	Clock Stuck Interrupt Flag 0: Clock works normally 1: HSE clock is stuck Reset by software (Write 1 clear). Set by hardware when HSE clock stuck and CKSIE is set.

AHB Configuration Register – AHBCFGR

This register specifies frequency of system clock.

Offset: 0x020

Reset value: 0x0000_0001

Bits	Field	Descriptions
[2:0]	AHBPRE	<p>AHB Pre-scaler</p> <p>000: CK_AHB = CK_SYS 001: CK_AHB = CK_SYS / 2 010: CK_AHB = CK_SYS / 4 011: CK_AHB = CK_SYS / 8 100: CK_AHB = CK_SYS / 16 101: CK_AHB = CK_SYS / 32 110: CK_AHB = CK_SYS / 32 111: CK_AHB = CK_SYS / 32</p> <p>Set and reset by software to control the division factor of the AHB clock.</p>

AHB Clock Control Register – AHBCCR

This register specifies clock enable bits of AHB.

Offset: 0x024

Reset value: 0x0000_0065

	31	30	29	28	27	26	25	24

Bits	Field	Descriptions
[24]	DIVEN	Divider Clock Enable 0: Divider clock is disabled 1: Divider clock is enabled Set and reset by software.
[18]	PCEN	GPIO Port C Clock Enable 0: Port C clock is disabled 1: Port C clock is enabled Set and reset by software.
[17]	PBEN	GPIO Port B Clock Enable 0: Port B clock is disabled 1: Port B clock is enabled Set and reset by software.
[16]	PAEN	GPIO Port A Clock Enable 0: Port A clock is disabled 1: Port A clock is enabled Set and reset by software.
[11]	CKREFEN	CK_REF Clock Enable 0: CK_REF clock is disabled 1: CK_REF clock is enabled Set and reset by software.
[6]	APBEN	APB bridge Clock Enable 0: APB bridge clock is automatically disabled by hardware during Sleep mode 1: APB bridge clock is always enabled during Sleep mode Set and reset by software. Users can set APBEN as 0 to reduce power consumption if the APB bridge is unused during Sleep mode.
[5]	BMEN	Bus Matrix Clock Enable 0: Bus Matrix clock is automatically disabled by hardware during Sleep mode 1: Bus Matrix clock is always enabled during Sleep mode Set and reset by software. Users can set BMEN as 0 to reduce power consumption if the bus matrix is unused during Sleep mode.

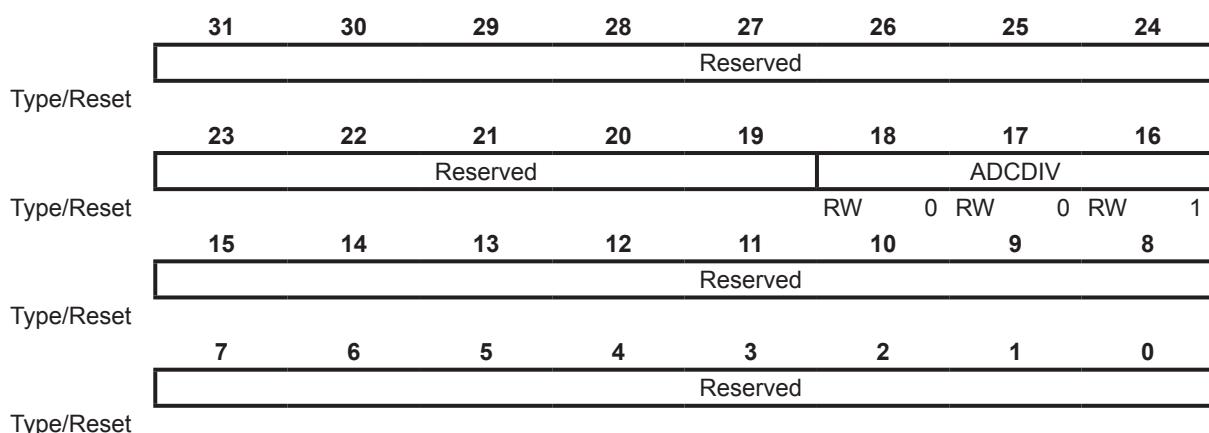

Bits	Field	Descriptions
[2]	SRAMEN	<p>SRAM Clock Enable</p> <p>0: SRAM clock is automatically disabled by hardware during Sleep mode</p> <p>1: SRAM clock is always enabled during Sleep mode</p> <p>Set and reset by software. Users can set SRAMEN as 0 to reduce power consumption if the SRAM is unused during Sleep mode.</p>
[0]	FMCEN	<p>Flash Memory Controller Clock Enable</p> <p>0: FMC clock is automatically disabled by hardware during Sleep mode</p> <p>1: FMC clock is always enabled during Sleep mode</p> <p>Set and reset by software. Users can set FMCEN as 0 to reduce power consumption if the Flash Memory is unused during Sleep mode.</p>

APB Configuration Register – APBCFGR

This register specifies the frequency of ADC conversion clock.

Offset: 0x028

Reset value: 0x0001_0000

Bits	Field	Descriptions
[18:16]	ADCDIV	<p>ADC Clock Frequency Divide Selection</p> <p>000: CK_ADC = (CK_AHB / 1) 001: CK_ADC = (CK_AHB / 2) 010: CK_ADC = (CK_AHB / 4) 011: CK_ADC = (CK_AHB / 8) 100: CK_ADC = (CK_AHB / 16) 101: CK_ADC = (CK_AHB / 32) 110: CK_ADC = (CK_AHB / 64) 111: CK_ADC = (CK_AHB / 3)</p> <p>Set and reset by software to control ADC conversion clock division factor.</p>

APB Clock Control Register 0 – APBCCR0

This register specifies clock enable bits of APB peripherals.

Offset: 0x02C

Reset value: 0x0000_0000

[13]	PWM1EN	PWM1 Clock Enable 0: PWM1 clock is disabled 1: PWM1 clock is enabled Set and reset by software.
[12]	PWM0EN	PWM0 Clock Enable 0: PWM0 clock is disabled 1: PWM0 clock is enabled Set and reset by software.
[8]	GPTMEN	GPTM Clock Enable 0: GPTM clock is disabled 1: GPTM clock is enabled Set and reset by software.
[6]	VDDREN	V _{DD} Domain Clock Enable for Registers Access 0: Register access clock is disabled 1: Register access clock is enabled Set and reset by software.
[4]	WDTREN	Watchdog Timer Clock Enable for Registers Access 0: Register access clock is disabled 1: Register access clock is enabled Set and reset by software.

Clock Source Status Register – CKST

This register specifies status of clock source.

Offset: 0x034

Reset value: 0x0100_0003

Bits	Field	Descriptions
[26:24]	HSIST	Internal High Speed Clock Occupation Status (CK_HSI) xx1: HSI is used by System Clock (CK_SYS) (SW = 0x3) x1x: Reserved 1xx: HSI is used by Clock Monitor
[17:16]	HSEST	External High Speed Clock Occupation Status (CK_HSE) x1: HSE is used by System Clock (CK_SYS) (SW = 0x2) 1x: Reserved
[2:0]	CKSWST	Clock Switch Status 00x: Reserved 010: CK_HSE as system clock 011: CK_HSI as system clock 110: CK_LSE as system clock 111: CK_LSI as system clock The fields are status to indicate which clock source is using as system clock currently.

APB Peripheral Clock Selection Register 0 – APBPCSR0

This register specifies APB peripheral clock prescaler selection.

Offset: 0x038

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24

HSI Control Register – HSICR

This register is to control the frequency trimming of HSI RC oscillation.

Offset: 0x040

Reset value: 0xFFFF_0000 where X is undefined

Bits	Field	Descriptions
[28:24]	HSICOARSE	HSI Clock Coarse Trimming Value These bits are initialized automatically at startup. They are adjusted by factory trimming and cannot trim by program.

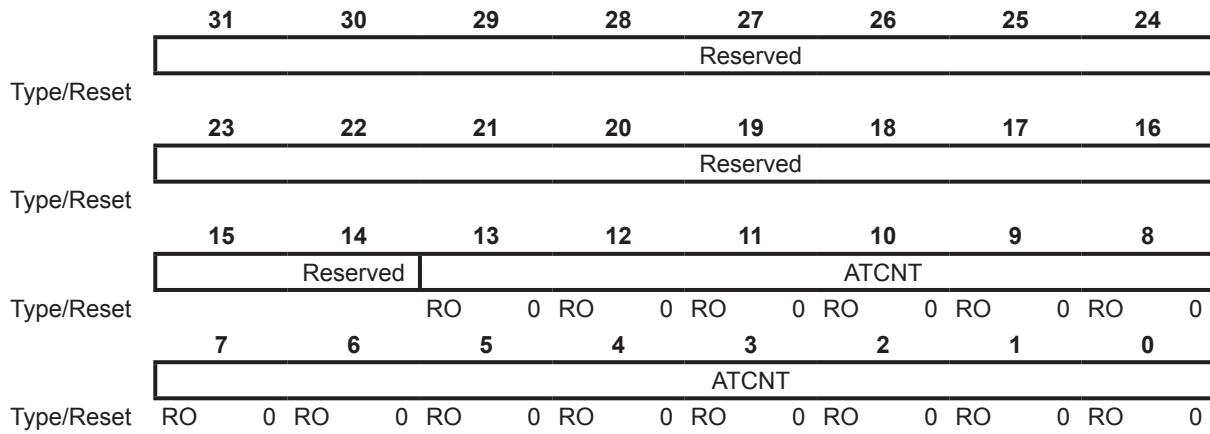

Bits	Field	Descriptions
[23:16]	HSIFINE	<p>HSI Clock Fine Trimming Value</p> <p>These bits are initialized automatically at startup. They are also adjusted by factory trimming. But these bits provide an additional user-programmable trimming value that is added to the HSICOARSE[4:0] bits to get more accurate or compensate the variations in voltage and temperature that influence the frequency of the HSI. It can be programmed by software or automatically adjusted by the Auto Trimming Controller (ATC) with an external reference clock.</p>
[7]	FLOCK	<p>Frequency Lock</p> <p>0: HSI frequency is not trimmed into target range 1: HSI frequency is trimmed into target range</p>
[6:5]	REFCLKSEL	<p>Reference Clock Selection</p> <p>0x: Select 32.768 kHz external low speed clock source (LSE) 1x: Select external pin (CKIN) 1 kHz pulse</p> <p>These bits are used to select the reference clock for the HSI Auto Trimming Controller.</p>
[4]	TMSEL	<p>Trimming Mode Selection</p> <p>0: Automatic by Auto Trimming Controller 1: Manual by user program</p> <p>This bit is used to select the HSI RC oscillator trimming function by ATC hardware or user programming via the HSIFINE[7:0] bits in the HSI Control Register.</p>
[3]	ATMSEL	<p>Automatic Trimming Mode Selection</p> <p>0: Auto Trimming Controller is used binary search to approach the target range 1: Auto Trimming Controller is used linear search to approach the target range</p> <p>This bit is selected the automatic trimming method by ATC hardware for HSI RC oscillator.</p>
[2]	LTRSEL	<p>Lock Target Range Selection</p> <p>0: 0.1 % variation 1: 0.2 % variation</p> <p>This bit is selected the lock target range of the internal HSI RC oscillator trimming function for 0.1 % or 0.2 % variation.</p>
[1]	ATCEN	<p>ATC Enable</p> <p>0: Disable Auto Trimming Controller 1: Enable Auto Trimming Controller</p>
[0]	TRIMEN	<p>Trimming Enable</p> <p>0: HSI Trimming is disable 1: HSI Trimming is enable</p> <p>The bit enables the HSI RC oscillator trimming function by ATC hardware or user programming.</p>

HSI Auto Trimming Counter Register – HSIATCR

This register contains the counter value of the HSI auto trimming controller.

Offset: 0x044

Reset value: 0x0000_0000

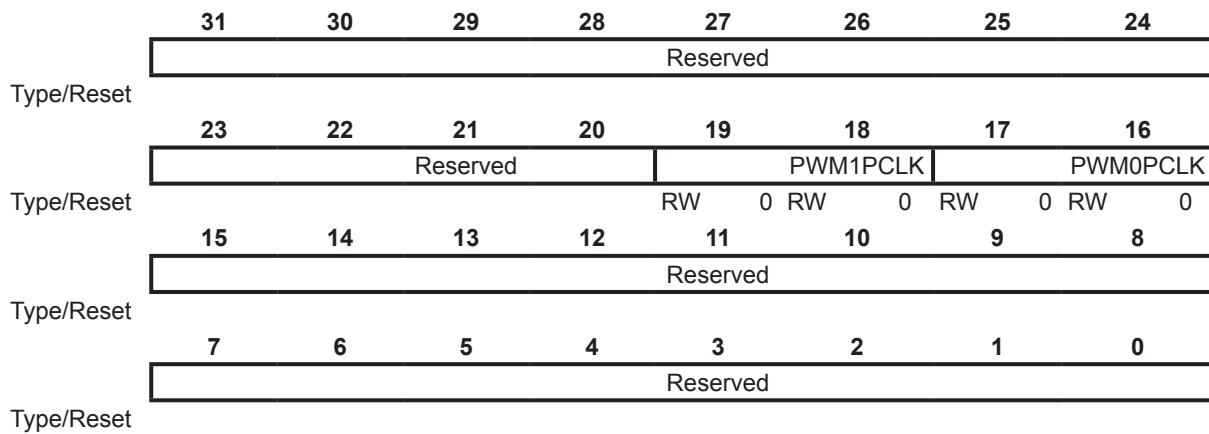

Bits	Field	Descriptions
[13:0]	ATCNT	Auto Trimming Counter These bits contain the counter value of the HSI auto trimming controller.

APB Peripheral Clock Selection Register 2 – APBPCSR2

This register specifies APB peripheral clock prescaler selection.

Offset: 0x048

Reset value: 0x0000_0000

Bits	Field	Descriptions
[19:18]	PWM1PCLK	PWM1 Peripheral Clock Selection 00: PCLK = CK_AHB 01: PCLK = CK_AHB / 2 10: PCLK = CK_AHB / 4 11: PCLK = CK_AHB / 8 PCLK = Peripheral Clock; CK_AHB = AHB and CPU clock
[17:16]	PWM0PCLK	PWM0 Peripheral Clock Selection 00: PCLK = CK_AHB 01: PCLK = CK_AHB / 2 10: PCLK = CK_AHB / 4 11: PCLK = CK_AHB / 8 PCLK = Peripheral Clock; CK_AHB = AHB and CPU clock

MCU Debug Control Register – MCUDBGCR

This register specifies debug control of MCU.

Offset: 0x304

Reset value: 0x0000_0000

7

Reset Control Unit (RSTCU)

Introduction

The Reset Control Unit, RSTCU, has three kinds of reset, the power on reset, system reset and APB unit reset. The power on reset, known as a cold reset, resets the full system during a power up. A system reset resets the processor core and peripheral IP components with the exception of the debug port controller. The resets can be triggered by an external signal, internal events and the reset generators. More information about these resets will be described in the following section.

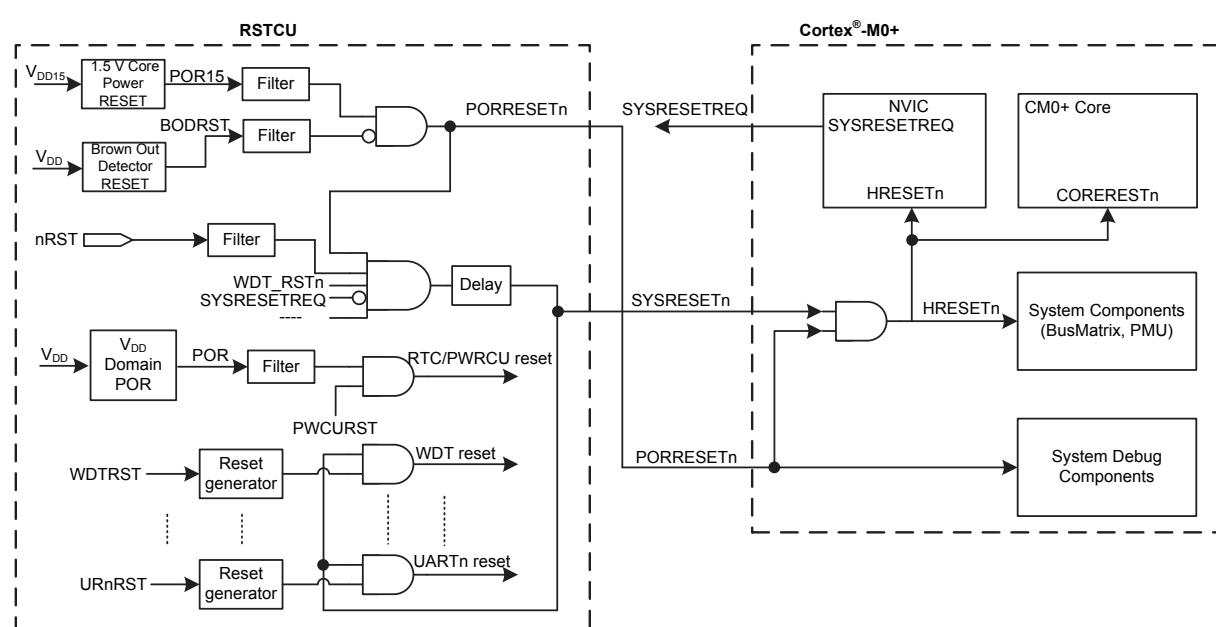

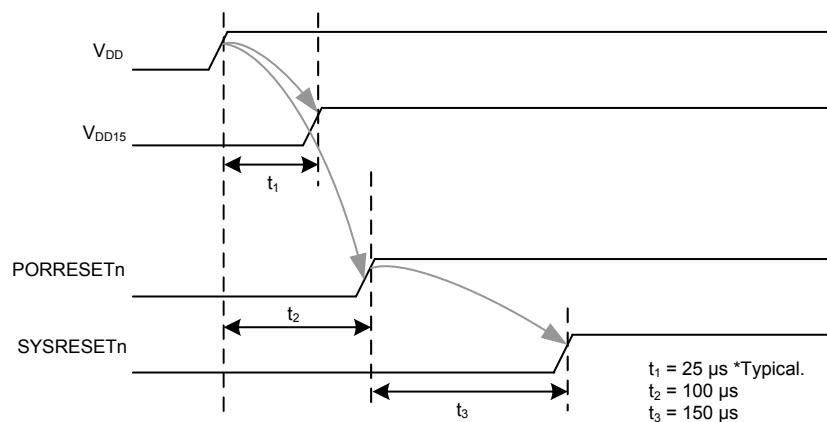

Figure 17. RSTCU Block Diagram

Functional Descriptions

Power On Reset

The Power on reset, POR, is generated by either an external reset or the internal reset generator. Both types have an internal filter to prevent glitches from causing erroneous reset operations. By referring to Figure 18, the POR15 active low signal will be de-asserted when the internal LDO voltage regulator is ready to provide a 1.5 V power. In addition to the POR15 signal, the Power Control Unit, PWRCU, will assert the BODF signal as a Power Down Reset, PDR, when the BODEN bit in the LVDCSR register is set and the brown-out event occurs. For more details about the PWRCU function, refer to the PWRCU chapter.

* This timing is dependent on the internal LDO regulator output capacitor value.

Figure 18. Power On Reset Sequence

System Reset

A system reset is generated by a power on reset (PORRESETn), a Watchdog Timer reset (WDT_RSTn), nRST pin or a software reset (SYSRESETREQ) event. For more information about SYSRESETREQ event, refer to the related chapter in the Cortex®-M0+ reference manual.

AHB and APB Unit Reset

The AHB and APB unit reset can be divided into hardware and software resets. A hardware reset can be generated by either power on reset or system reset for all AHB and APB units. Each functional IP connected to the AHB and APB buses can be reset individually through the associated software reset bits in the RSTCU. For example, the application software can generate a UART0 reset via the UR0RST bit in the APBPRSTR0 register.

Register Map

The following table shows the RSTCU registers and reset values.

Table 16. RSTCU Register Map

Register	Offset	Description	Reset Value
GRSR	0x100	Global Reset Status Register	0x0000_0008
AHBPRSTR	0x104	AHB Peripheral Reset Register	0x0000_0000
APBPRSTR0	0x108	APB Peripheral Reset Register 0	0x0000_0000
APBPRSTR1	0x10C	APB Peripheral Reset Register 1	0x0000_0000

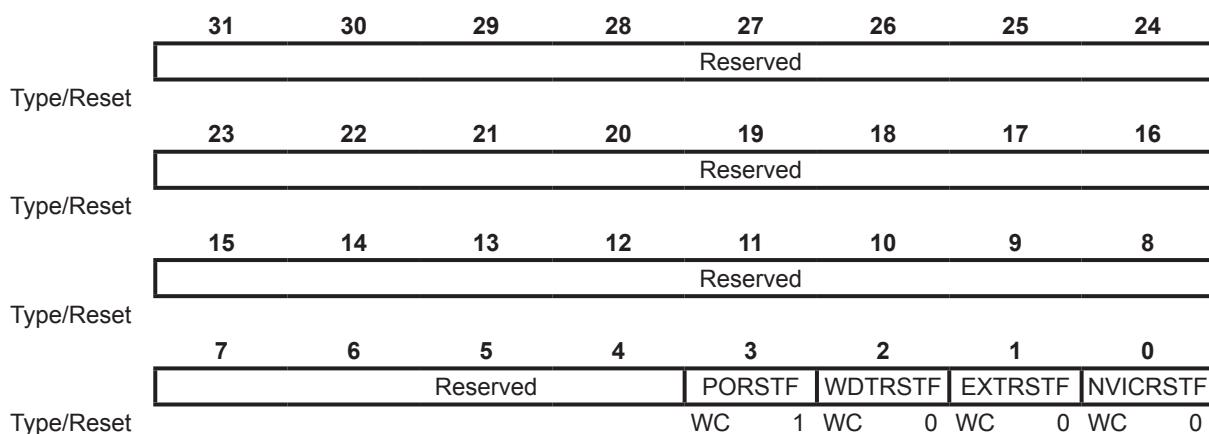

Register Descriptions

Global Reset Status Register – GRSR

This register specifies a variety of reset status conditions.

Offset: 0x100

Reset value: 0x0000_0008

Bits	Field	Descriptions
[3]	PORSTF	Core 1.5 V Power On Reset Flag 0: No POR occurred 1: POR occurred This bit is set by hardware when a power on reset occurs and reset by writing 1 into it.
[2]	WDTRSTF	Watchdog Timer Reset Flag 0: No Watchdog Timer reset occurred 1: Watchdog Timer occurred This bit is set by hardware when a watchdog timer reset occurs and reset by writing 1 into it or by hardware when a power on reset occurs.
[1]	EXTRSTF	External Pin Reset Flag 0: No pin reset occurred 1: Pin reset occurred This bit is set by hardware when an external pin reset occurs and reset by writing 1 into it or by hardware when a power on reset occurs.

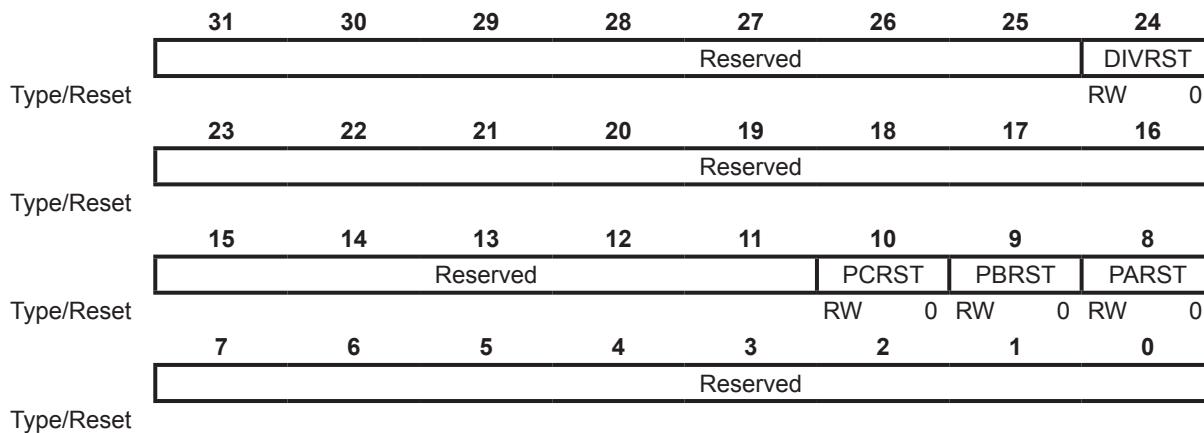

Bits	Field	Descriptions
[0]	NVICRSTF	<p>NVIC Reset Flag</p> <p>0: No NVIC asserting system reset occurred 1: NVIC asserting system reset occurred</p> <p>This bit is set by hardware when a system reset occurs and reset by writing 1 into it or by hardware when a power on reset occurs.</p>

AHB Peripheral Reset Register – AHBPRSTR

This register specifies several AHB peripherals software reset control bits.

Offset: 0x104

Reset value: 0x0000_0000

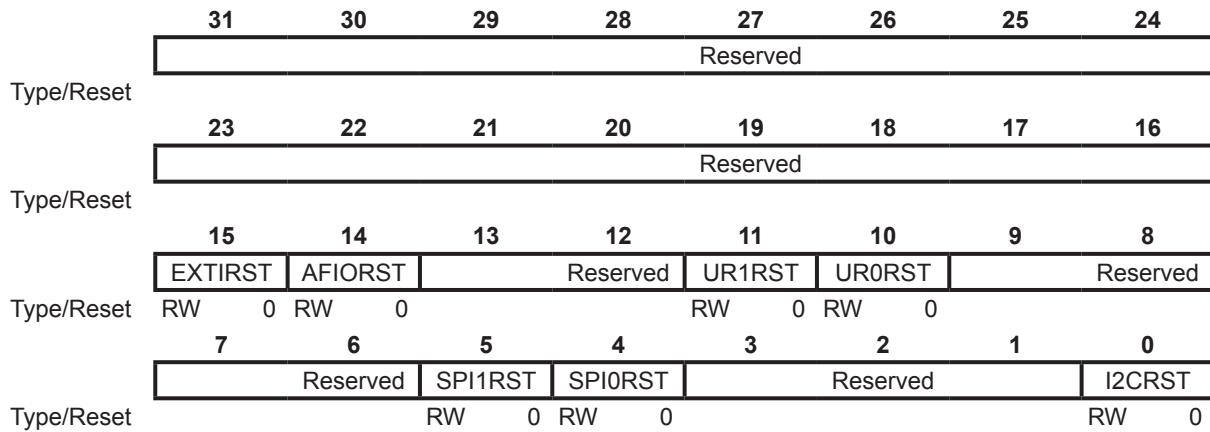

Bits	Field	Descriptions
[24]	DIVRST	<p>Divider Reset Control</p> <p>0: No reset 1: Reset Divider</p> <p>This bit is set by software and cleared to 0 by hardware automatically.</p>
[10]	PCRST	<p>GPIO Port C Reset Control</p> <p>0: No reset 1: Reset Port C</p> <p>This bit is set by software and cleared to 0 by hardware automatically.</p>
[9]	PBRST	<p>GPIO Port B Reset Control</p> <p>0: No reset 1: Reset Port B</p> <p>This bit is set by software and cleared to 0 by hardware automatically.</p>
[8]	PARST	<p>GPIO Port A Reset Control</p> <p>0: No reset 1: Reset Port A</p> <p>This bit is set by software and cleared to 0 by hardware automatically.</p>

APB Peripheral Reset Register 0 – APBPRSTR0

This register specifies several APB peripherals software reset control bits.

Offset: 0x108

Reset value: 0x0000_0000

Bits	Field	Descriptions
[15]	EXTIRST	External Interrupt Controller Reset Control 0: No reset 1: Reset EXTI This bit is set by software and cleared to 0 by hardware automatically.
[14]	AFIORST	Alternate Function I/O Reset Control 0: No reset 1: Reset Alternate Function I/O This bit is set by software and cleared to 0 by hardware automatically.
[11]	UR1RST	UART1 Reset Control 0: No reset 1: Reset UART1 This bit is set by software and cleared to 0 by hardware automatically.
[10]	UR0RST	UART0 Reset Control 0: No reset 1: Reset UART0 This bit is set by software and cleared to 0 by hardware automatically.
[5]	SPI1RST	SPI1 Reset Control 0: No reset 1: Reset SPI1 This bit is set by software and cleared to 0 by hardware automatically.
[4]	SPI0RST	SPI0 Reset Control 0: No reset 1: Reset SPI0 This bit is set by software and cleared to 0 by hardware automatically.
[0]	I2CRST	I ² C Reset Control 0: No reset 1: Reset I ² C This bit is set by software and cleared to 0 by hardware automatically.

APB Peripheral Reset Register 1 – APBPRSTR1

This register specifies several APB peripherals software reset control bits.

Offset: 0x10C

Reset value: 0x0000_0000

Bits	Field	Descriptions
[24]	ADCRST	A/D Converter Reset Control 0: No reset 1: Reset A/D Converter This bit is set by software and cleared to 0 by hardware automatically.
[16]	BFTMRST	BFTM Reset Control 0: No reset 1: Reset BFTM This bit is set by software and cleared to 0 by hardware automatically.
[13]	PWM1RST	PWM1 Reset Control 0: No reset 1: Reset PWM1 This bit is set by software and cleared to 0 by hardware automatically.
[12]	PWM0RST	PWM0 Reset Control 0: No reset 1: Reset PWM0 This bit is set by software and cleared to 0 by hardware automatically.
[8]	GPTMRST	GPTM Reset Control 0: No reset 1: Reset GPTM This bit is set by software and cleared to 0 by hardware automatically.
[4]	WDTRST	Watchdog Timer Reset Control 0: No reset 1: Reset Watchdog Timer This bit is set by software and cleared to 0 by hardware automatically.

8 General Purpose I/O (GPIO)

Introduction

There are up to 40 General Purpose I/O port, GPIO, named PA0 ~ PA15, PB0 ~ PB15 and PC0 ~ PC7 for the device to implement the logic input/output functions. Each of the GPIO ports has related control and configuration registers to satisfy the requirement of specific applications. The really available General Purpose I/O port numbers are dependent on the device specification and package type. Please refer the device data sheet for detail information.

The GPIO ports are pin-shared with other alternative functions (AFs) to obtain maximum flexibility on the package pins. The GPIO pins can be used as alternative functional pins by configuring the corresponding registers regardless of the AF input or output pins.

The external interrupts on the GPIO pins of the device have related control and configuration registers in the External Interrupt Control Unit (EXTI).

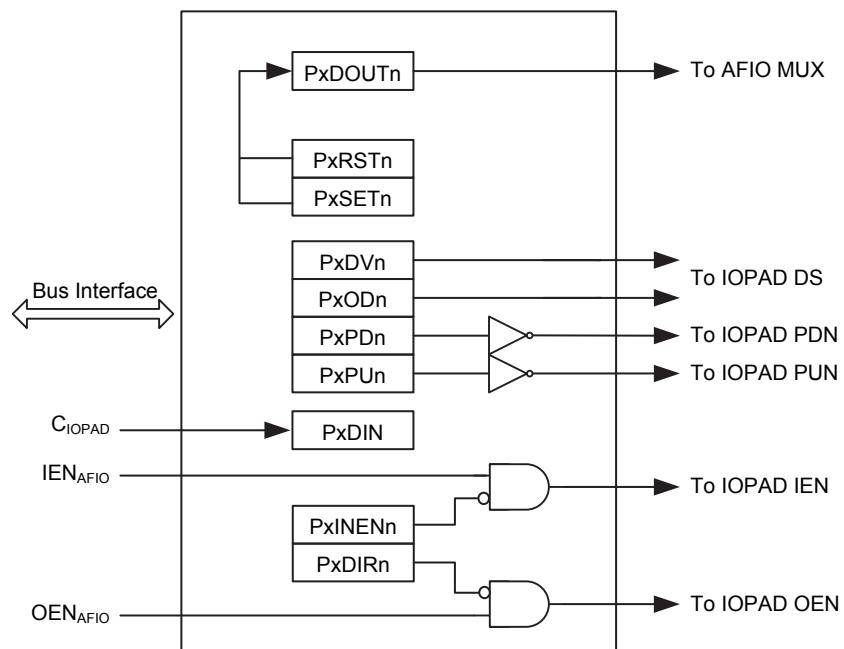

Figure 19. GPIO Block Diagram

Features

- Input / output direction control
- Input weak pull-up / pull-down control
- Output push-pull / open-drain enable control
- Output set / reset control
- Output drive current selection
- External interrupt with programmable trigger edge – Using EXTI configuration registers
- Analog input / output configurations – Using AFIO configuration registers
- Alternate function input / output configurations – Using AFIO configuration registers
- Port configuration lock

Functional Descriptions

Default GPIO Pin Configuration

During or just after the reset period, the alternative functions are all inactive and the GPIO ports are configured into the input disable floating mode, i.e. input disabled without pull-up / pull-down resistors. Only the boot and Serial-Wired Debug pins which are pin-shared with the I/O pins are active after a device reset.

- BOOT: Input enable with internal pull-up
- SWCLK: Input enable with internal pull-up
- SWDIO: Input enable with internal pull-up

General Purpose I/O – GPIO

The GPIO pins can be configured as inputs or outputs via the data direction control registers PxDIRCR (where x = A ~ C). When the GPIO pins are configured as input pins, the data on the external pads can be read if the enable bits in the input enable function register PxINER are set. The GPIO pull-up / pull-down registers PxPUR / PxPDR can be configured to fit specific applications. When the pull-up and pull-down functions are both enabled, the pull-up function has the higher priority while the pull-down function will be blocked until the pull-up function is released.

The GPIO pins can be configured as output pins where the output data is latched into the data register PxDOUTR. The output type can be setup to be either push-pull or open-drain by the open drain selection register PxODR. Only one or several specific bits of the output data will be set or reset by configuring the port output set and reset control register PxSRR or the port output reset control register PxRR without affecting the unselected bits. As the port output set and reset functions are both enabled, the port output set function has the higher priority and the port output reset function will be blocked. The output driving current of the GPIO pins can be selected by configuring the drive current selection register PxDRVRR.

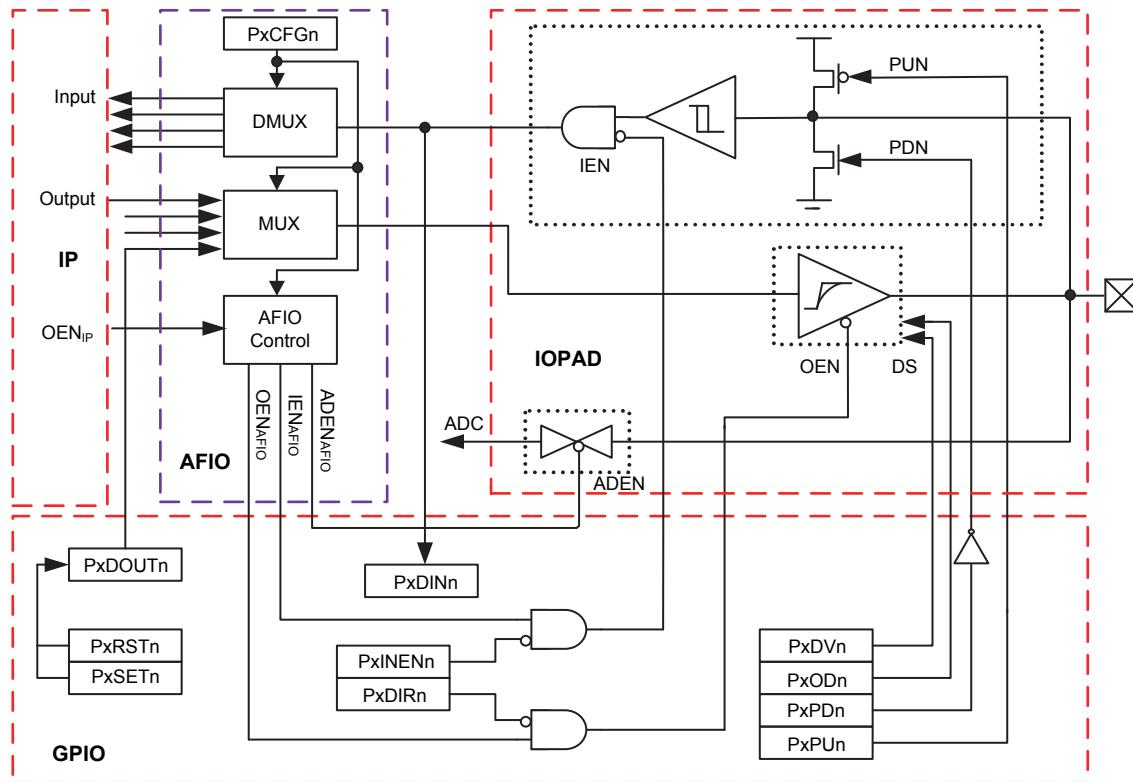

Figure 20. AFIO / GPIO Control Signal

PxDINn / PxDOUTn (x = A ~ C): Data Input / Data Output

PxRSTn / PxSETn (x = A ~ C): Reset / Set

PxINENN (x = A ~ C): Input Enable

PxODn (x = A ~ C): Open Drain

PxCFGn (x = A ~ C): AFIO Configuration

PxDIRn (x = A ~ C): Direction

PxDVn (x = A ~ C): Output Drive

PxPDn / PxPUn (x = A ~ C): Pull Down / Up

Table 17. AFIO, GPIO and I/O Pad Control Signal True Table

Type	AFIO			GPIO		PAD		
	ADEN _{AFIO}	OEN _{AFIO}	IEN _{AFIO}	PxDIRn	PxINENN	ADEN	OEN	IEN
GPIO Input (Note)	1	1	1	0	1	1	1	0
GPIO Output (Note)	1	1	1	1	0 (1 if need)	1	0	1 (0)
AFIO Input	1	1	0	0	X	1	1	0
AFIO Output	1	0	1	X	0 (1 if need)	1	0	1 (0)
ADC Input	0	1	1	0	0 (1 if need)	0	1	1 (0)
OSC Output	0	1	1	0	0 (1 if need)	0	1	1 (0)

Note: The signals, IEN and OEN, for I/O pads are derived from the GPIO register bits PxINENN and PxDIRn respectively when the associated pin is configured in the GPIO input / output mode.

GPIO Locking Mechanism

The GPIO also offers a lock function to lock the port until a reset event occurs. The PxLOCKR ($x = A \sim C$) registers are used to lock the port x and lock control options. The value 0x5FA0 is written into the PxLKEY field in the PxLOCKR registers to freeze the PxDIRCR, PxINER, PxPUR, PxPDR, PxODR, PxDRVVR control and AFIO mode configuration (GPxCFGHR or GPxCFGLR, where $x = A \sim C$). If the value in the PxLOCKR register is 0x5FA0_0001, it means that the Port x Lock function is enabled and the Port x pin 0 is frozen.

Register Map

The following table shows the GPIO registers and reset values of the Port A ~ C.

Table 18. GPIO Register Map

Register	Offset	Description	Reset Value
GPIO A Base Address = 0x400B_0000

Register Descriptions

Port A Data Direction Control Register – PADIRCR

This register is used to control the direction of the GPIO Port A pin as input or output.

Offset: 0x000

Reset value: 0x0000_0000

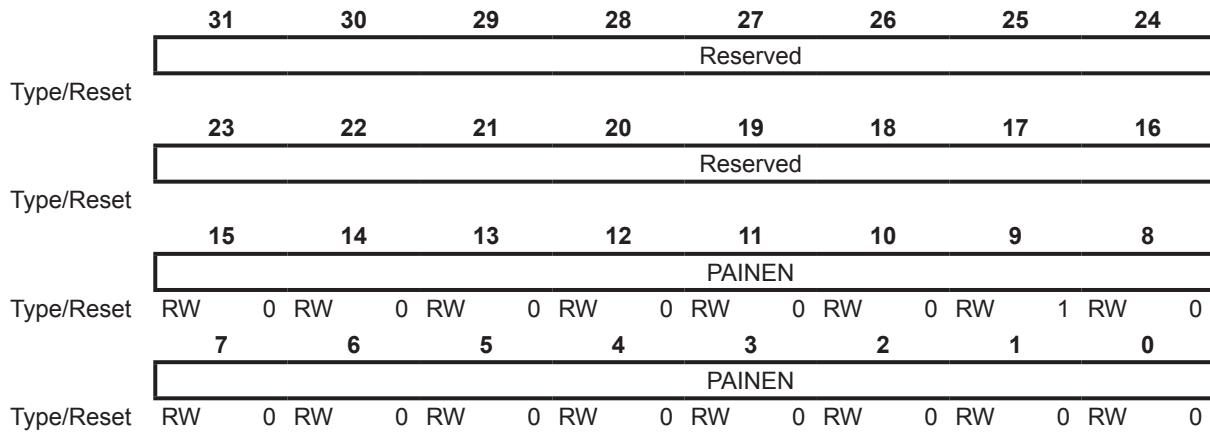

Bits	Field	Descriptions
[15:0]	PADIRn	GPIO Port A pin n Direction Control Bits (n = 0 ~ 15) 0: Pin n is in input mode 1: Pin n is in output mode

Port A Input Function Enable Control Register – PAINER

This register is used to enable or disable the GPIO Port A input function.

Offset: 0x004

Reset value: 0x0000_0200

Bits	Field	Descriptions
[15:0]	PAINENn	<p>GPIO Port A pin n Input Enable Control Bits (n = 0 ~ 15)</p> <p>0: Pin n input function is disabled 1: Pin n input function is enabled</p> <p>When the pin n input function is disabled, the input Schmitt trigger will be turned off and the Schmitt trigger output will remain at a zero state.</p>

Port A Pull-Up Selection Register – PAPUR

This register is used to enable or disable the GPIO Port A pull-up function.

Offset: 0x008

Reset value: 0x0000_3200

	31	30	29	28	27	26	25	24

Type/Reset	RW	0	RW	0	RW	0	RW	0
7 6 5 4 3 2 1 0								
PALOCK								
Type/Reset	RW	0	RW	0	RW	0	RW	0

Bits	Field	Descriptions
[31:16]	PALKEY	<p>GPIO Port A Lock Key</p> <p>0x5FA0: Port A Lock function is enabled Others: Port A Lock function is disabled</p> <p>To lock the Port A function, a value of 0x5FA0 should be written into the PALKEY field in this register. To execute a successful write operation on this lock register, the value written into the PALKEY field must be 0x5FA0. If the value written into this field is not equal to 0x5FA0, any write operations on the PALOCKR register will be aborted. The result of a read operation on the PALKEY field returns the GPIO Port A Lock Status which indicates whether the GPIO Port A is locked or not. If the read value of the PALKEY field is 0, this indicates that the GPIO Port A Lock function is disabled. Otherwise, it indicates that the GPIO Port A Lock function is enabled as the read value is equal to 1.</p>
[15:0]	PALOCKn	<p>GPIO Port A Pin n Lock Control Bits (n = 0 ~ 15)</p> <p>0: Port A Pin n is not locked 1: Port A Pin n is locked</p> <p>The PALOCKn bits are used to lock the configurations of corresponding GPIO Pins when the correct Lock Key is applied to the PALKEY field. The locked configurations including PADIRn, PAINENn, PAPUn, PAPDn, PAODn and PADVn setting in the related GPIO registers. Additionally, the GPACFGHR or GPACFGLR field register which is used to configure the alternative function of the associated GPIO pin will also be locked. Note that the PALOCKR register can only be written once which means that PALKEY and PALOCKn (lock control bit) should be written together and can not be changed until a system reset or GPIO Port A reset occurs.</p>

Port A Data Input Register – PADINR

This register specifies the GPIO Port A input data.

7 6 5 4 3 2 1 0								
PBLOCK								
Type/Reset	RW	0	RW	0	RW	0	RW	0

Bits	Field	Descriptions
[31:16]	PBLKEY	<p>GPIO Port Block Key</p> <p>0x5FA0: Port Block function is enabled Others: Port B Lock function is disabled</p> <p>To lock the Port B function, a value of 0x5FA0 should be written into the PBLKEY field in this register. To execute a successful write operation on this lock register, the value written into the PBLKEY field must be 0x5FA0. If the value written into this field is not equal to 0x5FA0, any write operations on the PBLOCKR register will be aborted. The result of a read operation on the PBLKEY field returns the GPIO Port B Lock Status which indicates whether the GPIO Port B is locked or not. If the read value of the PBLKEY field is 0, this indicates that the GPIO Port B Lock function is disabled. Otherwise, it indicates that the GPIO Port B Lock function is enabled as the read value is equal to 1.</p>
[15:0]	PBLOCKn	<p>GPIO Port B pin n Lock Control Bits (n = 0 ~ 15)</p> <p>0: Port B pin n is not locked 1: Port B pin n is locked</p> <p>The PBLOCKn bits are used to lock the configurations of corresponding GPIO Pins when the correct Lock Key is applied to the PBLKEY field. The locked configurations including PBDIRn, PBINENn, PBPUn, PBPDn, PBOFn and PBDVn setting in the related GPIO registers. Additionally, the GPBCFGHR or GPBCFGLR register which is used to configure the alternative function of the associated GPIO pin will also be locked. Note that the PBLOCKR register can only be written once which means that PBLKEY and PBLOCKn (lock control bit) should be written together and can not be changed until a system reset or GPIO Port B reset occurs.</p>

Port B Data Input Register – PBDINR

This register specifies the GPIO Port B input data.

9 Alternate Function Input / Output Control Unit (AFIO)

Introduction

In order to expand the flexibility of the GPIO or the usage of peripheral functions, each I/O pin can be configured to have up to sixteen different functions such as GPIO or IP functions by setting the GPxCFGRL or GPxCFGHR register where x is the different port name. According to the usage of the IP resource and application requirements, suitable pin-out locations can be selected by using the peripheral I/O remapping mechanism. Additionally, various GPIO pins can be selected to be the EXTI interrupt line by setting the EXTInPIN [3:0] field in the ESSRn register to trigger an interrupt or event. Please refer to the EXTI section for more details.

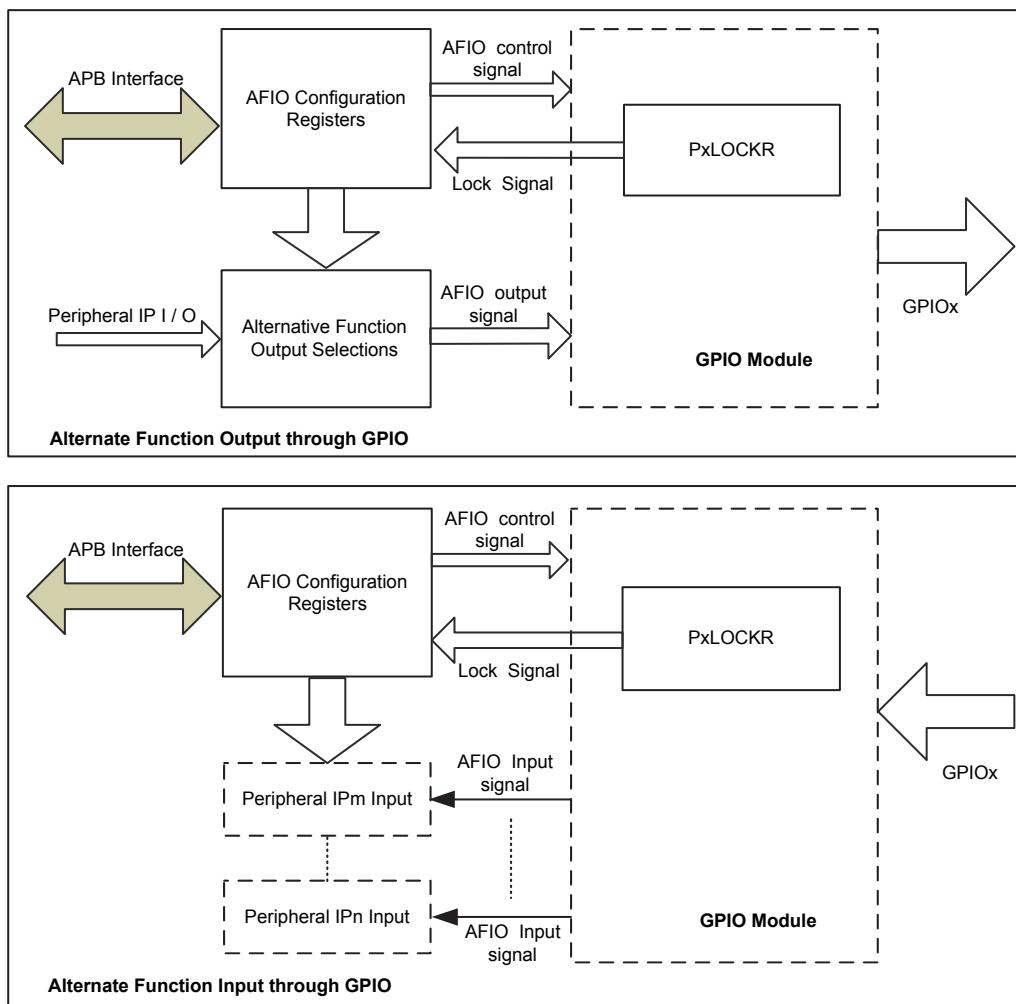

Figure 21. AFIO Block Diagram

Features

- APB slave interface for register access
- EXTI source selection
- Configurable pin function for each GPIO, up to sixteen alternative functions on each pin
- AFIO lock mechanism

Functional Descriptions

External Interrupt Pin Selection

The GPIO pins are connected to the 16 EXTI lines as shown in the accompanying figure. For example, users can set the EXTI0PIN [3:0] field in the ESSR0 register to b0000 to select the GPIO PA0 pin as EXTI line 0 input. Since not all the pins of the Port A ~ C are available in all package types, please refer to the pin assignment section for detailed pin information. The setting of the EXTIInPIN [3:0] field is invalid when the corresponding pin is not available.

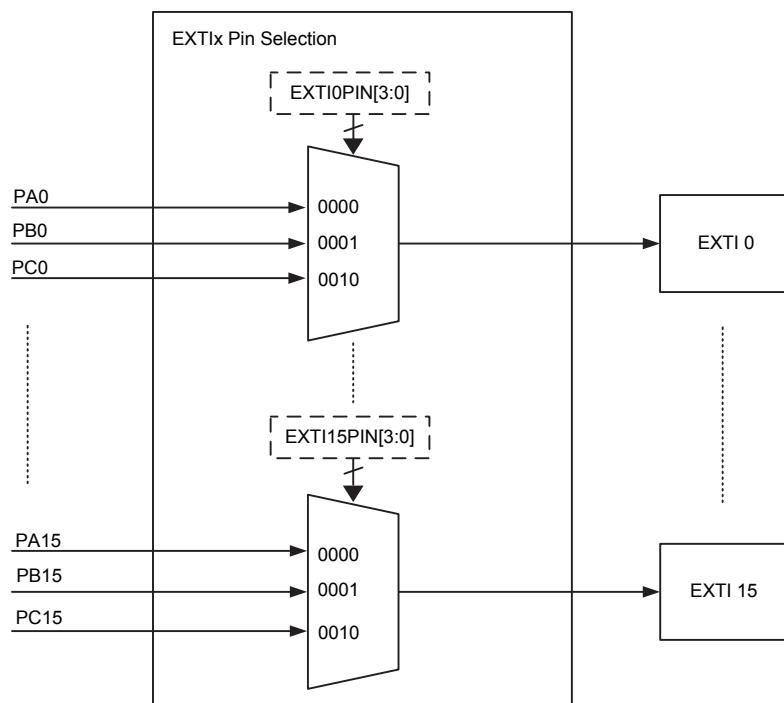

Figure 22. EXTI Channel Input Selection

Alternate Function

Up to sixteen alternative functions can be chosen for each I/O pad by setting the PxCFGn [3:0] field in the GPxCFGCLR or GPxCFGHHR (n = 0~15, x = A~C) registers. If the pin is selected as unavailable item which is noted as “N/A” item in the “Alternate Function Mapping” table of the device datasheet, this pin will be defined as default alternate function. Refer to the “Alternate Function Mapping” table in the device datasheet for the detailed mapping of the alternate function I/O pins. In addition to this flexible I/O multiplexing architecture, each peripheral has alternate functions mapped onto different I/O pins to optimize the number of peripherals available in smaller packages. The following description shows the setting of the PxCFGn [3:0] field.

- PxCFGn [3:0] = 0000: The default alternated function (after reset, AF0)
- PxCFGn [3:0] = 0001: Alternate Function 1 (AF1)
- PxCFGn [3:0] = 0010: Alternate Function 2 (AF2)
-
- PxCFGn [3:0] = 1110: Alternate Function 14 (AF14)
- PxCFGn [3:0] = 1111: Alternate Function 15 (AF15)

Table 19. AFIO Selection for Peripheral Map Example

AF0	AF1	AF2	AF3	AF4	AF5	AF6	AF7	AF8	AF9	AF10	AF11	AF12	AF13	AF14	AF15
System Default	GPIO	ADC	N/A	GPTM	SPI	UART	I ² C	N/A	N/A	N/A	N/A	N/A	PWM	N/A	System Other

Lock Mechanism

The device also offers a lock function to lock the AFIO configuration using the GPIO lock register, PxLOCKR, until a reset event occurs. Refer to the GPIO Locking Mechanism section in the GPIO chapter for more details.

Register Map

The following table shows the AFIO registers and reset value.

Table 20. AFIO Register Map

10 Nested Vectored Interrupt Controller (NVIC)

Introduction

In order to reduce the latency and increase the interrupt processing efficiency, a tightly coupled integrated section, which is named as Nested Vectored Interrupt Controller (NVIC) is provided by the Cortex®-M0+. The NVIC controls the system exceptions and the peripheral interrupts which include functions such as the enable / disable control, priority, clear-pending, active status report, software trigger and vector table remapping. Refer to the Technical Reference Manual of Cortex®-M0+ for more details.

Additionally, an integrated simple, 24-bit down count timer (SysTick) is provided by the Cortex®-M0+ to be used as a tick timer for the Real Timer Operation System (RTOS) or as a simple counter. The SysTick counts down from the reloaded value and generates a system interrupt when it reaches zero. The accompanying table lists the system exceptions types and a variety of peripheral interrupts.

Table 21. Exception Types

Interrupt Number	Exception Number	Exception Type	Priority	Vector Address	Description
—	0	—	—	0x000	Initial Stack Point value
—	1	Reset	-3 (Highest)	0x004	Reset
-14	2	NMI	-2	0x008	Non-Maskable Interrupt. The clock stuck interrupt signal (clock monitor function provided by Clock Control Unit) is connected to the NMI input
-13	3	Hard Fault	-1	0x00C	All fault classes
—	4-10	Reserved	—	—	—
-5	11	SVCall	Configurable ⁽¹⁾	0x02C	SVC instruction System service call

29	45	Reserved	—	0x0B4	—
30	46	Reserved	—	0x0B8	—
31	47	Reserved	—	0x0BC	—

Notes: 1. The exception priority can be changed using the NVIC System Handler Priority Registers. For more information, refer to the Arm® “Cortex®-M0+ Devices Generic User Guide” document.
2. The interrupt priority can be changed using the NVIC Interrupt Priority Registers. For more information, refer to the Arm® “Cortex®-M0+ Devices Generic User Guide” document.

Features

- 7 system Cortex®-M0+ exceptions
- Up to 32 Maskable peripheral interrupts
- 4 programmable priority levels (2 bits for interrupt priority setting)
- Non-Maskable interrupt
- Low-latency exception and interrupt handling
- Vector table remapping capability
 - Integrated simple, 24-bit system timer, SysTick
 - 24-bit down-counter
 - Auto-reloading capability
 - Maskable system interrupt generation when counter decreases to 0
 - SysTick clock source derived from the HCLK clock divided by 8

Function Descriptions

SysTick Calibration

The SysTick Calibration Value Register (SYST_CALIB) is provided by the NVIC to give a reference time base of 1ms for the RTOS tick timer or other purposes. The TENMS field in the SYST_CALIB register has a fixed value of 2500 which is the counter reload value to indicate 1 ms when the clock source comes from the SysTick reference input clock STCLK with a frequency of 2.5 MHz (20 MHz divide by 8).

Register Map

The following table shows the NVIC registers and reset values.

Table 22. NVIC Register Map

Register	Offset	Description	Reset Value

Note: For more detailed information of the above register, please refer to the “Cortex®-M0+ Devices Generic User Guide” document from Arm®.

11

External Interrupt / Event Controller (EXTI)

Introduction

The External Interrupt / Event Controller, EXTI, comprises 16 edge detectors which can generate a wakeup event or interrupt requests independently. In the interrupt mode there are five trigger types which can be selected as the external interrupt trigger type, low level, high level, negative edge, positive edge and both edges, selectable using the SRCnTYPE field in the EXTCFGnR (n = 0 ~ 15) register. In the wakeup event mode, the wakeup event polarity can be configured by setting the EXTInWPOL (n = 0 ~ 15) field in the EXTIWAKUPPCR register. If the EVWUPIEN bit in the EXTIWAKUPPCR Register is set, the EVWUP interrupt can be generated when the associated wakeup event occurs and the corresponding EXTI wakeup enable bit is set. Each EXTI line can also be masked independently.

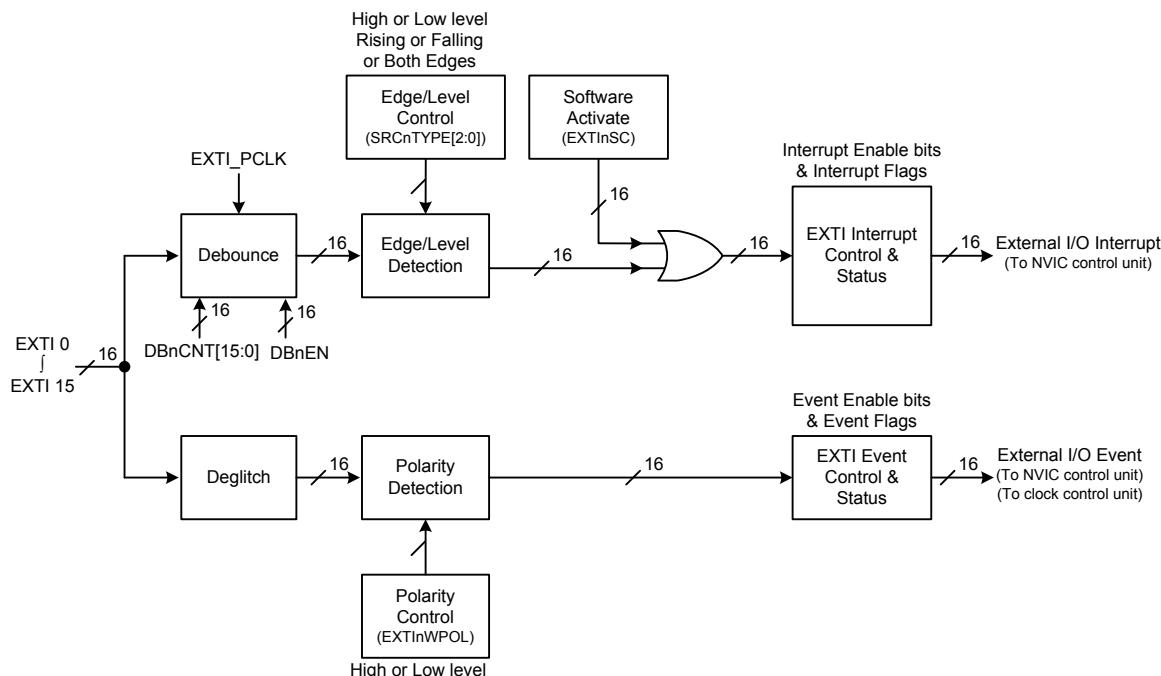

Figure 23. EXTI Block Diagram

Features

- Up to 16 EXTI lines with configurable trigger source and type
 - All GPIO pins can be selected as EXTI trigger source
 - Source trigger type includes high level, low level, negative edge, positive edge or both edge
- Individual interrupt enable, wakeup enable and status bits for each EXTI line
- Software interrupt trigger mode for each EXTI line
- Integrated deglitch filter for short pulse blocking

Function Descriptions

Wakeup Event Management

In order to wakeup the system from the power saving mode, the EXTI controller provides a function which can monitor external events and send them to the CPU core and the Clock Control Unit, CKCU. These external events include EXTI events, Low Voltage Detection, WAKEUP input pins and RTC wakeup function. By configuring the wakeup event enable bit in the corresponding peripheral, the wakeup signal will be sent to the CPU and the CKCU via the EXTI controller when the corresponding wakeup event occurs. Additionally, the software can enable the event wakeup interrupt function by setting the EVWUPIEN bit in the EXTIWAKUPCR register and the EXTI controller will then assert an interrupt when the wakeup event occurs.

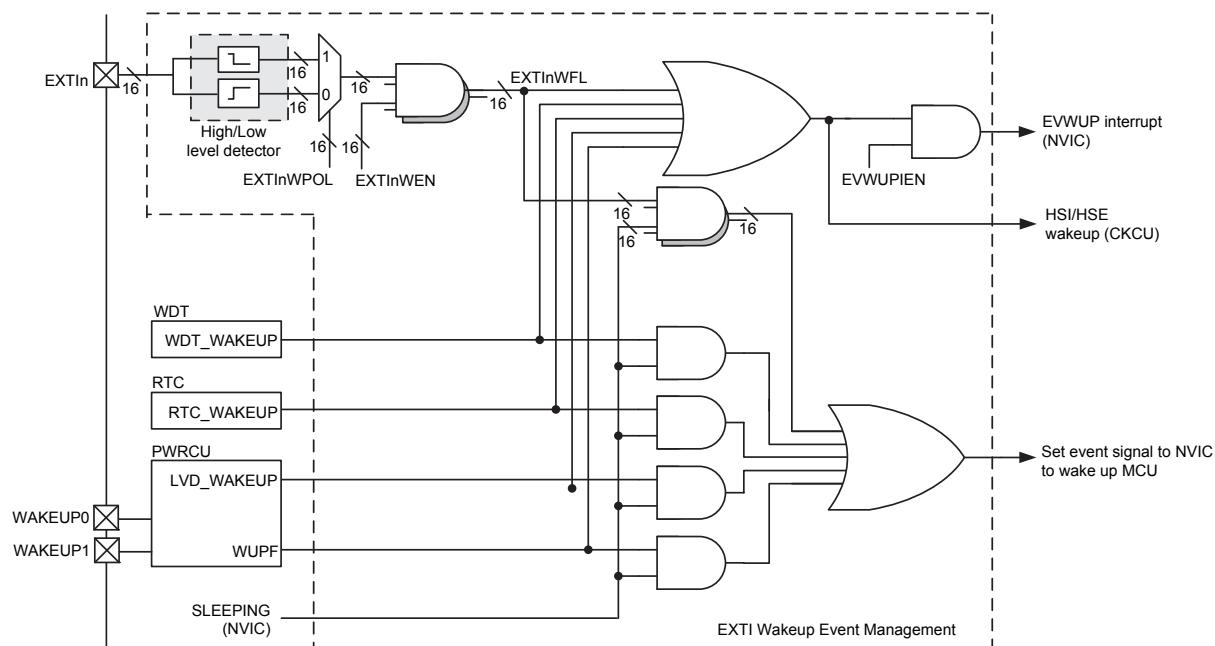

Figure 24. EXTI Wakeup Event Management

External Interrupt / Event Line Mapping

All GPIO pins can be selected as EXTI trigger sources by configuring the EXTInPIN [3:0] field in the AFIO ESSR_n (n= 0 ~ 1) register to trigger an interrupt or event. Refer to the AFIO section for more details.

Interrupt and Debounce

The application software can set the DBnEN bit in the EXTIn Interrupt Configuration Register EXTICFG_n (n= 0 ~ 15) to enable the corresponding pin de-bounce function and configure the DBnCNT field in the EXTICFG_n so as to select an appropriate debounce time for specific applications. The interrupt signal will however be delayed due to the de-bounce function. When the device is woken up from the power saving mode by an external interrupt, an interrupt request will be generated by the EXTI wakeup flag. After the device has been woken up and the clock has recovered, the EXTI wakeup flag that was triggered by the EXTI line must be read and then cleared by application software. The accompanying diagram shows the relationship between the EXTI input signal and the EXTI interrupt / event request signal.

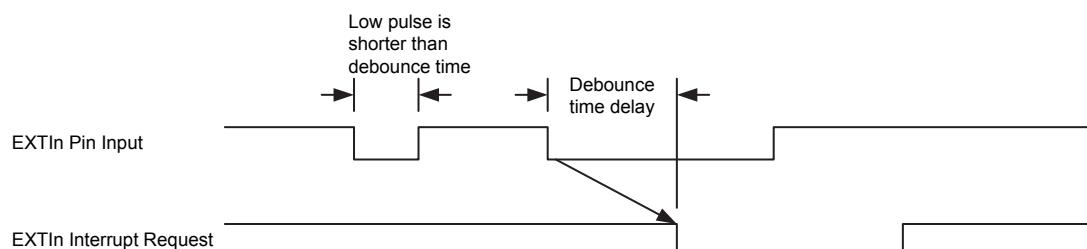

Figure 25. EXTI Interrupt Debounce Function

Register Map

The following table shows the EXTI registers and reset values.

Table 23. EXTI Register Map

12 Analog to Digital Converter (ADC)

Introduction

A 12-bit multi-channel Analog to Digital Converter is integrated in the device. There are a total of 14 multiplexed channels including 12 external channels on which the external analog signal can be supplied and 2 internal channels. If the input voltage is required to remain within a specific threshold window, the Analog Watchdog function will monitor and detect the signal. An interrupt will then be generated to inform that the input voltage is higher or lower than the set thresholds. There are three conversion modes to convert an analog signal to digital data. The A/D conversion can be operated in one shot, continuous and discontinuous conversion mode. A 16-bit data register is provided to store the data after conversion.

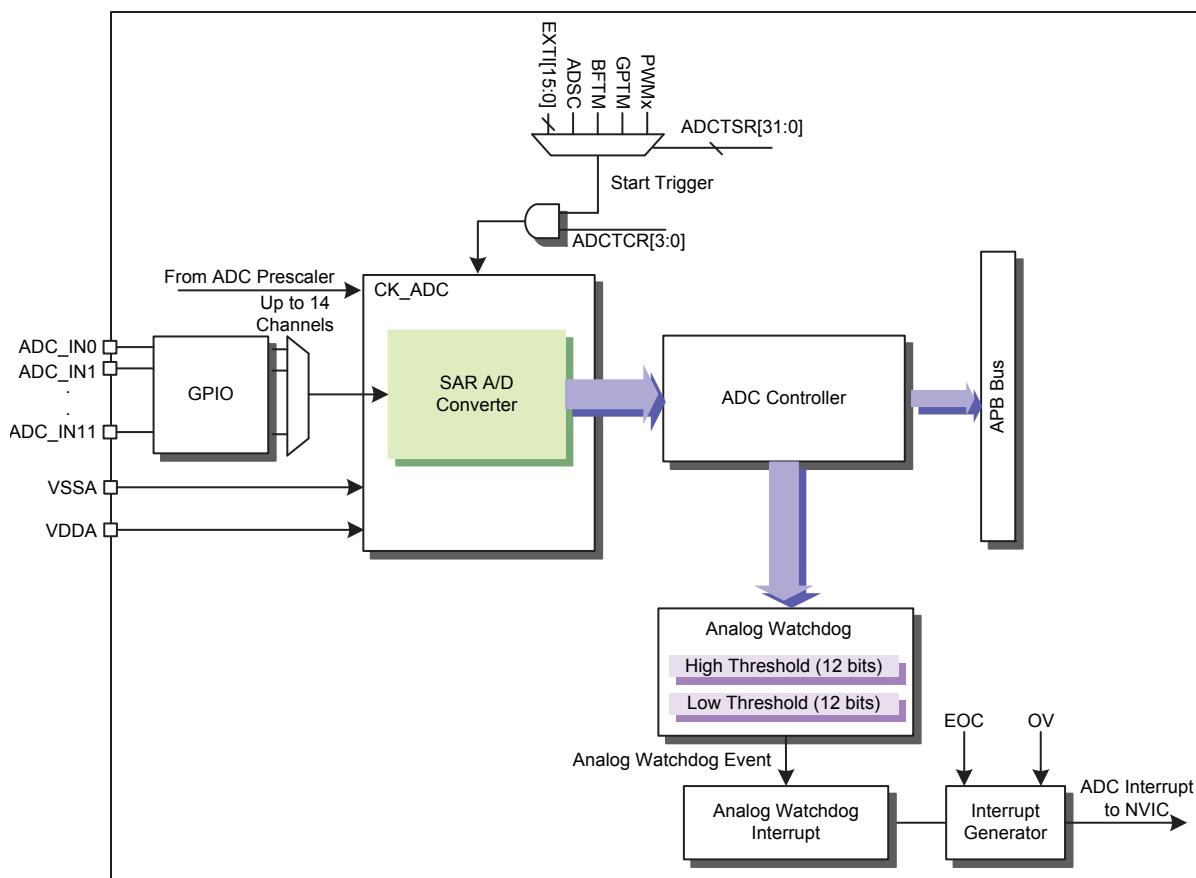

Figure 26. ADC Block Diagram

Features

- 12-bit SAR ADC engine
- Up to 1 Msps conversion rate
- 12 external analog input channels
- 2 internal analog input channels for reference voltage detection
- Programmable sampling time for conversion channel
- Up to 8 programmable conversion channel sequence and dedicated data registers for conversion result
- Three conversion modes
 - One shot conversion mode
 - Continuous conversion mode
 - Discontinuous conversion mode
- Analog watchdog for predefined voltage range monitor
 - Lower / upper threshold register
 - Interrupt generation
- Various trigger start sources for conversion modes
 - Software trigger
 - EXTI – External interrupt input pin
 - GPTM trigger
 - PWM0 / PWM1 trigger
 - BFTM trigger
- Multiple generated interrupts
 - End of single conversion
 - End of subgroup conversion
 - End of cycle conversion
 - Analog Watchdog
 - Data register overwriting

Function Descriptions

ADC Clock Setup

The ADC clock, CK_ADC is provided by the Clock Controller which is synchronous and divided by with the AHB clock known as HCLK. Refer to the Clock Control Unit chapter for more details. Notes that ADC peripheral needs keeping at least two ADC clock cycles to switch between power-on and power off stage (ADEN bit = '0').

Channel Selection

The A/D converter supports 14 multiplexed channels and converts the conversion results into ADC conversion data register. A conversion group can organize a sequence which can be implemented arranged in a specific conversion sequence length from 1 to 8. For example, conversion can be carried out with the following channel sequence: CH2, CH4, CH7, CH5, CH6, CH3, CH0 and CH1 one after another.

A group is composed of up to 8 conversions. The selected channels of the group conversion can be specified in the ADCLST0 ~ ADCLST1 registers. The total conversion sequence length is setup using the ADSEQL[2:0] bits in the ADCCR register.

Modifying the ADCCR or ADCLSTn register during a conversion process will reset the current conversion, after which a new start pulse is required to restart a new conversion.

Conversion Mode

The A/D has three operating conversion modes. The conversion modes are One Shot Conversion Mode, Continuous Conversion Mode and Discontinuous Conversion mode. Details are provided later.

One Shot Conversion Mode

In one shot conversion mode, the ADC will perform conversion cycles on the channels specified in the A/D conversion list registers ADCLSTn with a specific sequence when an A/D converter event trigger occurs. When the A/D conversion mode field ADMODE [1:0] in the ADCCR register is set to 0x0, the A/D converter will operate in the One Shot Conversion Mode. This mode can be started by a software trigger, an external EXTI event or a Timer event determined by the Trigger Control Register ADCTCR and the Trigger Source Register ADCTS.R.

After Conversion

- The converted data will be stored in the 16-bit ADCDRy (y = 0 ~ 7) registers.
- The ADC regular single sample end of conversion event raw status flag, ADIRAWS, in the ADCIRAW register will be set when the single sample conversion is finished.
- An interrupt will be generated after a single sample end of conversion if the ADIES bit in the ADCIER register is enabled.
- An interrupt will be generated after a regular group cycle end of conversion if the ADIEC bit in the ADCIER register is enabled.

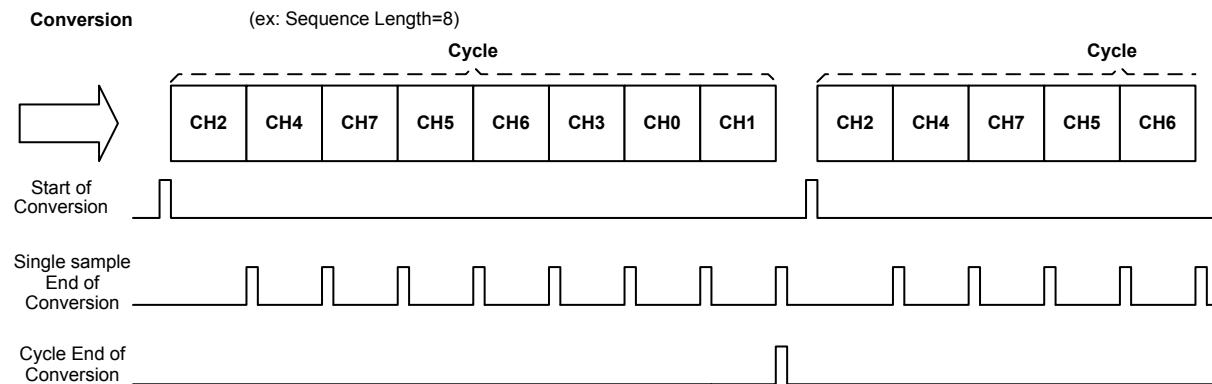

Figure 27. One Shot Conversion Mode

Continuous Conversion Mode

In Continuous Conversion Mode, repeated conversion cycle will start automatically without requiring additional A/D start trigger signals after a channels group conversion has completed. When the A/D conversion mode field ADMODE[1:0] is set to 0x2, the A/D converter will operate in the Continuous Conversion Mode which can be started by a software trigger, an external EXTI event or a Timer event determined by the Trigger Control Register ADCTCR and the Trigger Source Register ADCTS.R.

After conversion:

- The converted data will be stored in the 16-bit ADCDRy ($y = 0 \sim 7$) registers.
- The ADC regular group and high priority group cycle end of conversion event raw status flag, ADIRAWC, in the ADCIRAW register will be set when the conversion cycle is finished.
- An interrupt will be generated after a regular or high priority group cycle end of conversion if the ADIEC bit in the ADCIER register is enabled.

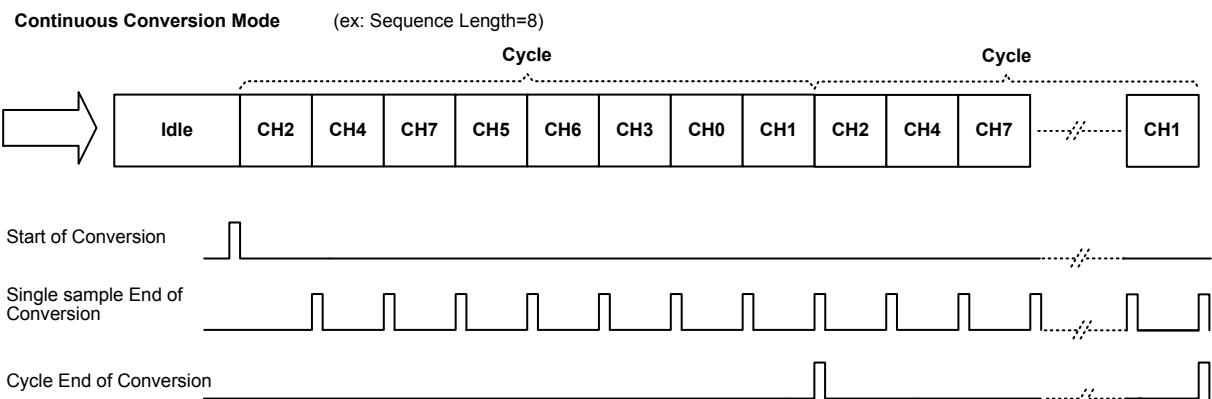

Figure 28. Continuous Conversion Mode

Discontinuous Conversion Mode

The A/D converter will operate in the Discontinuous Conversion Mode for channels group when the A/D conversion mode bit field ADMODE [1:0] in the ADCCR register is set to 0x3. The group to be converted can have up to 8 channels and can be arranged in a specific sequence by configuring the ADCLSTn registers where n ranges from 0 to 1. This mode is provided to convert data for the group with a short sequence, named as the A/D conversion subgroup, each time a trigger event occurs. The subgroup length is defined by the ADSUBL [2:0] field in the ADCCR register to specify the subgroup length. In the Discontinuous Conversion Mode the A/D converter can be started by a software trigger, an external EXTI event or a TM event for regular groups determined by the Trigger Control Register ADCTCR and the Trigger Source Register ADCTS.R.

In the Discontinuous Conversion Mode, the A/D Converter will start to convert the next n conversions where the number n is the subgroup length defined by the ADSUBL field. When a trigger event occurs, the channels to be converted with a specific sequence are specified in the ADCLSTn registers. After n conversions have completed, the regular subgroup EOC interrupt raw flag ADIRAWG in the ADCIRAW register will be asserted. The A/D converter will now not continue to perform the next n conversions until the next trigger event occurs. The conversion cycle will end after all the group channels, of which the total number is defined by the ADSEQL[2:0] bits in the ADCCR register, have finished their conversion, at which point the cycle EOC interrupt raw flag ADIRAWC in the ADCIRAW register will be asserted. If a new trigger event occurs after all the subgroup channels have all been converted, i.e., a complete conversion cycle has been finished, the conversion will restart from the first subgroup.

Example:

A/D subgroup length = 3 (ADSUBL = 2) and sequence length = 8 (ADSEQL = 7), channels to be converted = 2, 4, 7, 5, 6, 3, 0 and 1 – specific converting sequence as defined in the ADCLSTn registers.

- Trigger 1: subgroup channels to be converted are CH2, CH4 and CH7 with the ADIRAWG flag being asserted after subgroup EOC.
- Trigger 2: subgroup channels to be converted are CH5, CH6 and CH3 with the ADIRAWG flag being asserted after subgroup EOC.
- Trigger 3: subgroup channels to be converted are CH0 and CH1 with the ADIRAWG flag being asserted after subgroup EOC. Also a Cycle end of conversion (EOC) interrupt raw flag ADIRAWC will be asserted.
- Trigger 4: subgroup channels to be converted are CH2, CH4 and CH7 with the ADIRAWG flag being asserted – conversion sequence restarts from the beginning.

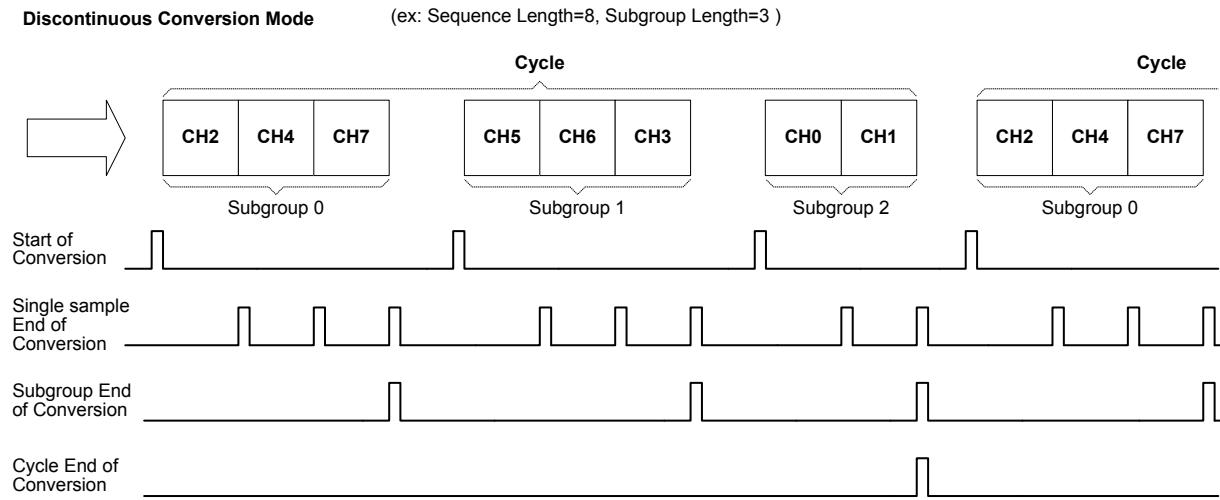

Figure 29. Discontinuous Conversion Mode

Start Conversion on External Event

An A/D converter conversion can be initiated by a software trigger, a General-Purpose Timer Module (GPTM) event, a PWM Trigger Event, a Basic Function Timer Module (BFTM) event or an external trigger. Each trigger source can be enabled by setting the corresponding enable control bit in the ADCTCR register and then selected by configuring the associated selection bits in the ADCTS register to start a group channel conversion.

An A/D converter conversion can be started by setting the software trigger bit, ADSC, in the ADCTS register for the group channel when the software trigger enable bit, ADSW, in the ADCTCR register is set to 1. After the A/D converter starts converting the analog data, the corresponding enable bit ADSC will be cleared to 0 automatically.

The A/D converter can also be triggered to start a group conversion by a Timer event. The Timer events include a PWM master trigger output MTO, four PWM channel outputs CH0~CH3, a GPTM master trigger output MTO, four GPTM channel outputs CH0~CH3 and a BFTM trigger output. If the corresponding Timer trigger enable bit is set to 1 and the trigger output or the Timer channel event is selected via the relevant Timer event selection bits, the A/D converter will start a conversion when a rising edge of the selected trigger event occurs.

In addition to the internal trigger sources, the A/D converter can be triggered to start a conversion by an external trigger event. The external trigger event is derived from the external lines of the EXTI unit. If the external trigger enable bit ADEXTI is set to 1 and the corresponding EXTI line is selected by configuring the ADEXTIS field in the ADCTS register, the A/D converter will start a conversion when an EXTI line activity occurs.

Sampling Time Setting

The conversion channel can be programmed the sampling time according to the input resistance of the input voltage source. This sampling time must be enough for the input voltage source to charge the internal sample and hold capacitor of the converter to the input voltage level. By modifying the ADST [7:0] bits in the ADCSTR register, the sampling time of the analog input signal can be determined.

The total conversion time (T_{conv}) is calculated using the following formula:

$$T_{conv} = T_{Sampling} + T_{Latency}$$

Where the minimum sampling time $T_{Sampling} = 1.5$ cycles (when ADST[7:0] = 0) and the minimum channel conversion latency $T_{Latency} = 12.5$ cycles.

Example:

With the A/D Converter clock CK_ADC = 14 MHz and a sampling time = 1.5 cycles:

$$T_{conv} = 1.5 + 12.5 = 14 \text{ cycles} = 1 \mu\text{s}$$

Data Format

The ADC conversed result can be read in the ADCDR register and output data format which is shown as following Table 24.

Table 24. Data Format in ADCDR [15:0]

Description	ADCDR Register Data Format
Right aligned	"0_0_0_0_d11_d10_d9_d8_d7_d6_d5_d4_d3_d2_d1_d0"

Analog Watchdog

The A/D converter includes a watchdog function to monitor the converted data. There are two kinds of thresholds for the watchdog monitor function, known as the watchdog lower threshold and watchdog upper threshold, which are specified by the ADLT bit field and ADUT bit field in the ADCTR register respectively. The watchdog monitor function is enabled by setting the watchdog upper and lower threshold monitor function enable bits, ADWUE and ADWLE, in the watchdog control register ADCWCR. The channel to be monitored can be specified by configuring the ADWCH and ADWALL bits. When the converted data is less or higher than the lower or upper threshold, as defined by the ADLT bit field and ADUT bit field in the ADCTR register respectively, the watchdog lower or upper threshold interrupt raw flags, ADIRAWL or ADIRAWU in the ADCIRAW register, will be asserted if the watchdog lower or upper threshold monitor function is enabled. If the lower or upper threshold interrupt raw flag is asserted and the corresponding interrupt is enabled by setting the ADIEL or ADIEU bit in the ADCIER register, the A/D watchdog lower or upper threshold interrupt will be generated.

Interrupts

When an A/D conversion is completed, an End of Conversion EOC event will occur. There are three kinds of EOC events which are known as single sample EOC, subgroup EOC and cycle EOC for A/D conversion. A single sample EOC event will occur and the single sample EOC interrupt raw flag, ADIRAWS bits in the ADCIRAW register, will be asserted when a single channel conversion has completed. A subgroup EOC event will occur and the subgroup EOC interrupt raw flag, ADIRAWG in the ADCIRAW register, will be asserted when a subgroup conversion has completed. A cycle EOC event will occur and the cycle EOC interrupt raw flag, ADIRAWC bits in the ADCIRAW register, will be asserted when a cycle conversion is finished. When a single sample EOC, a subgroup EOC or a cycle EOC raw flag is asserted and the corresponding interrupt enable bit, ADIES, ADIEG or ADIEC bit in the ADCIER register, is set to 1, the associated interrupt will be generated.

After a conversion has completed, the 12-bit digital data will be stored in the associated ADCDRn registers and the value of the data valid flag named as ADVLDn will be changed from low to high. The converted data should be read by the application program, after which the data valid flag ADVLDn will be automatically changed from high to low. Otherwise, a data overwrite event will occur and the data overwrite interrupt raw flag ADIRAWO bit in the ADCIRAW register will be asserted. When the related data overwrite raw flag is asserted, the data overwrite interrupt will be generated if the interrupt enable bit ADIEO in the ADCIER register is set to 1.

If the A/D watchdog monitor function is enabled and the data after a channel conversion is less than the lower threshold or higher than the upper threshold, the watchdog lower or upper threshold interrupt raw flag ADIRAWL or ADIRAWU in the ADCIRAW register will be asserted. When the ADIRAWL or ADIRAWU flag is asserted and the corresponding interrupt enable bit, ADIEL or ADIEU in the ADCIER register, is set a watchdog lower or upper threshold interrupt will be generated.

The A/D Converter interrupt clear bits are used to clear the associated A/D converter interrupt raw and interrupt status bits. Writing a 1 into the specific A/D converter interrupt clear bit in the A/D converter interrupt clear register ADCICLR will clear the corresponding A/D converter interrupt raw status and interrupt status bits. These bits are automatically cleared to 0 by hardware after being set to 1.

Register Map

The following table shows the A/D Converter registers and reset values.

Table 25. A/D Converter Register Map

Register Descriptions

ADC Conversion Control Register – ADCCR

This register specifies the mode setting, sequence length and subgroup length of ADC conversion mode. Note that once the content of ADCCR is changed, the conversion in progress will be aborted and the A/D converter will return to an idle state. The application program has to wait for at least one CK_ADC clock before issuing the next command.

Offset: 0x000

Reset value: 0x0000_0000

Bits	Field	Descriptions
[18:16]	ADSUBL	ADC Conversion Subgroup Length The ADSUBL field specifies the conversion channel length of each subgroup for regular discontinuous mode. Subgroup length = ADSUBL [2:0] + 1. If the sequence length (ADSEQL [2:0] + 1) is not a multiple of the subgroup length (ADSUBL [2:0] + 1), the last subgroup will be the rest of the group channels that have not been converted.
[10:8]	ADSEQL	ADC Conversion Length 0x00: The channel specified by the ADSEQ0 field in the ADCLST0 register will be converted Others: Length of list queue = ADSEQL [2:0] + 1 The ADSEQL field specifies the whole conversion sequence length for the conversion group.
[7]	ADCEN	ADC Enable 0: Disable 1: Enable
[6]	ADCRST	ADC Reset 0: No effect 1: Reset A/D converter except for the A/D Converter controller

ADC Conversion Data Register y – ADCDRy, y = 0 ~ 7

This register is used to store the conversion data of the conversion sequence order No.y which is specified by the ADSEQy field in the ADCLSTn (n= 0 ~ 1) registers.

Offset: 0x030 ~ 0x04C

Reset value: 0x0000_0000

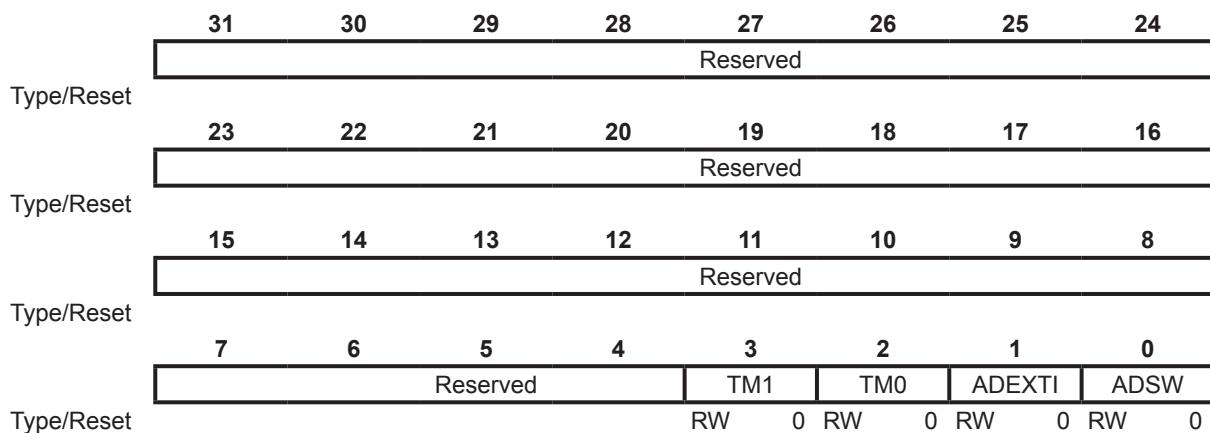

Bits	Field	Descriptions
[31]	ADVLDy	ADC Conversion Data of Sequence Order No.y Valid Bit (y = 0 ~ 7) 0: Data are invalid or have been read 1: New data are valid
[15:0]	ADDy	ADC Conversion Data of Sequence Order No.y (y = 0 ~ 7) The conversion result of Sequence Order ADSEQy in the ADCLSTn (n = 0 ~ 1) registers

ADC Trigger Control Register – ADCTCR

This register contains the ADC start conversion trigger enable bits.

Offset: 0x070

Reset value: 0x0000_0000

Bits	Field	Descriptions
[3]	TM1	ADC Conversion BFTM or PWM Event Trigger enable control 0: Disable conversion trigger by BFTM or PWM events 1: Enable conversion trigger by BFTM or PWM events

13 General-Purpose Timer (GPTM)

Introduction

The General-Purpose Timer consists of one 16-bit up / down-counter, four 16-bit Capture / Compare Registers (CCRs), one 16-bit Counter-Reload Register (CRR) and several control / status registers. It can be used for a variety of purposes including general timer, input signal pulse width measurement or output waveform generation such as single pulse generation or PWM output. The GPTM supports an encoder interface using a quadrature decoder with two inputs.

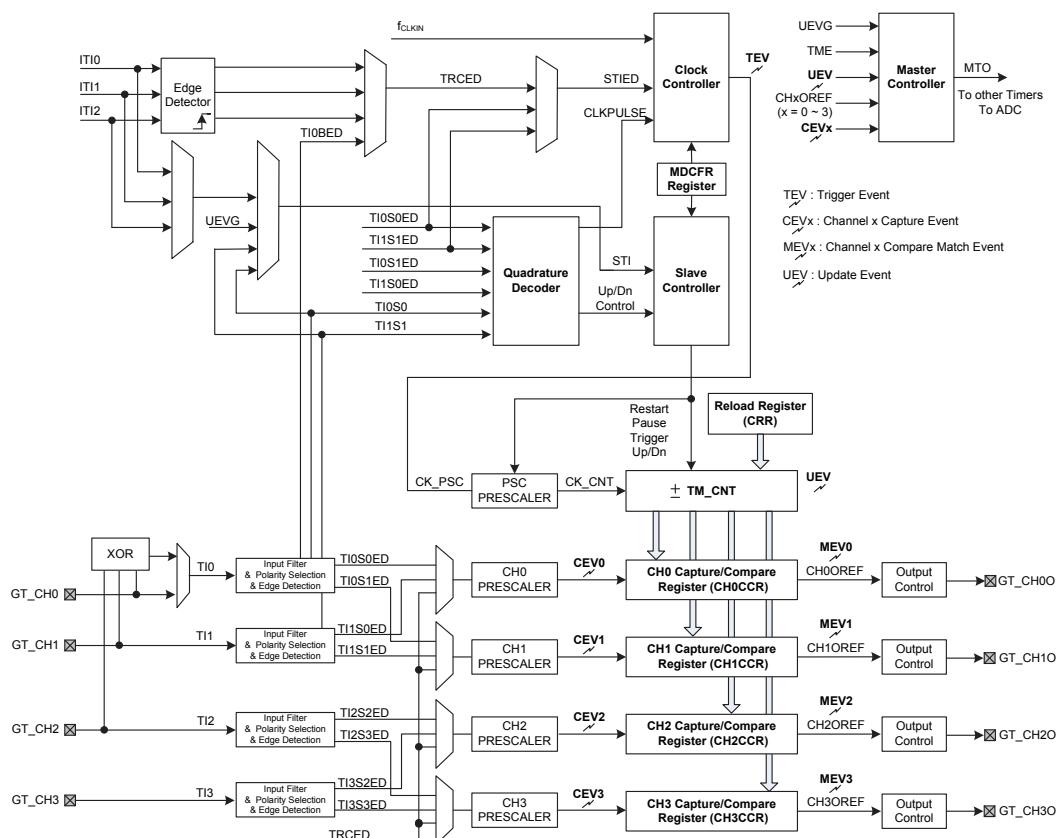

Figure 30. GPTM Block Diagram

Features

- 16-bit up / down auto-reload counter
- 16-bit programmable prescaler that allows division of the counter clock frequency by any factor between 1 and 65536
- Up to 4 independent channels for:
 - Input Capture function
 - Compare Match Output

- Generation of PWM waveform – Edge and Center-aligned Mode
- Single Pulse Mode Output
- Encoder interface controller with two inputs using quadrature decoder
- Synchronization circuit to control the timer with external signals and to interconnect several timers together
- Interrupt generation with the following events:
 - Update event
 - Trigger event
 - Input capture event
 - Output compare match event
- GPTM Master / Slave mode controller

Functional Descriptions

Counter Mode

Up-Counting

In this mode the counter counts continuously from 0 to the counter-reload value, which is defined in the CRR register, in a count-up direction. Once the counter reaches the counter-reload value, the Timer Module generates an overflow event and the counter restarts to count once again from 0. This action will continue repeatedly. The counting direction bit DIR in the CNTCFR register should be set to 0 for the up-counting mode.

When the update event is generated by setting the UEVG bit in the EVGR register to 1, the counter value will also be initialized to 0.

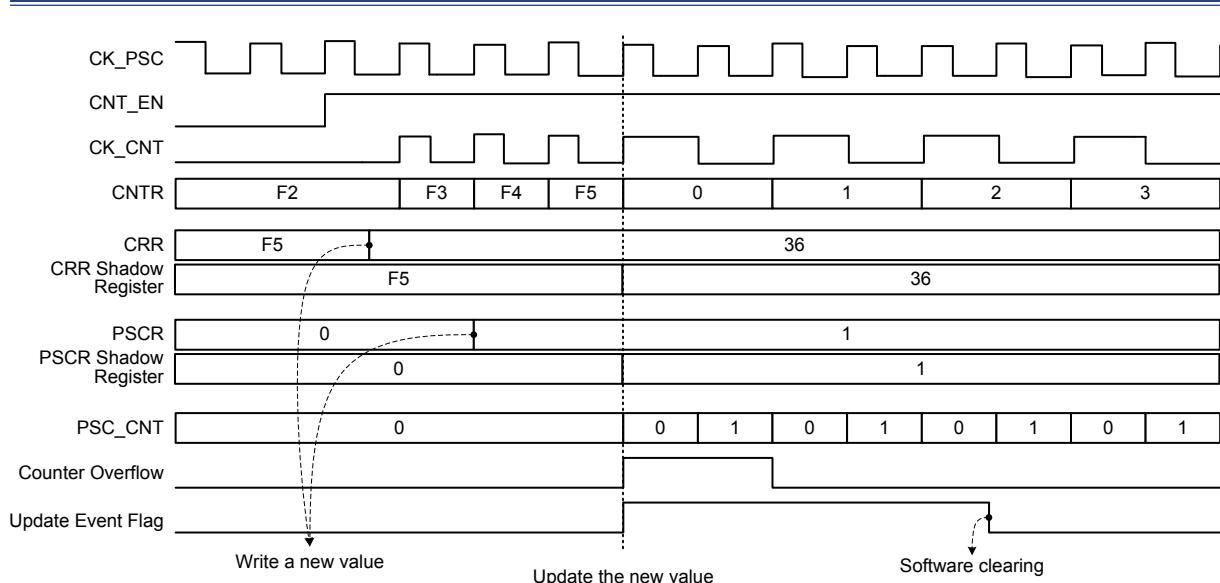

Figure 31. Up-counting Example

Down-Counting

In this mode the counter counts continuously from the counter-reload value, which is defined in the CRR register, to 0 in a count-down direction. Once the counter reaches 0, the Timer module generates an underflow event and the counter restarts to count once again from the counter-reload value. This action will continue repeatedly. The counting direction bit DIR in the CNTCFR register should be set to 1 for the down-counting mode.

When the update event is set by the UEVG bit in the EVGR register, the counter value will also be initialized to the counter-reload value.

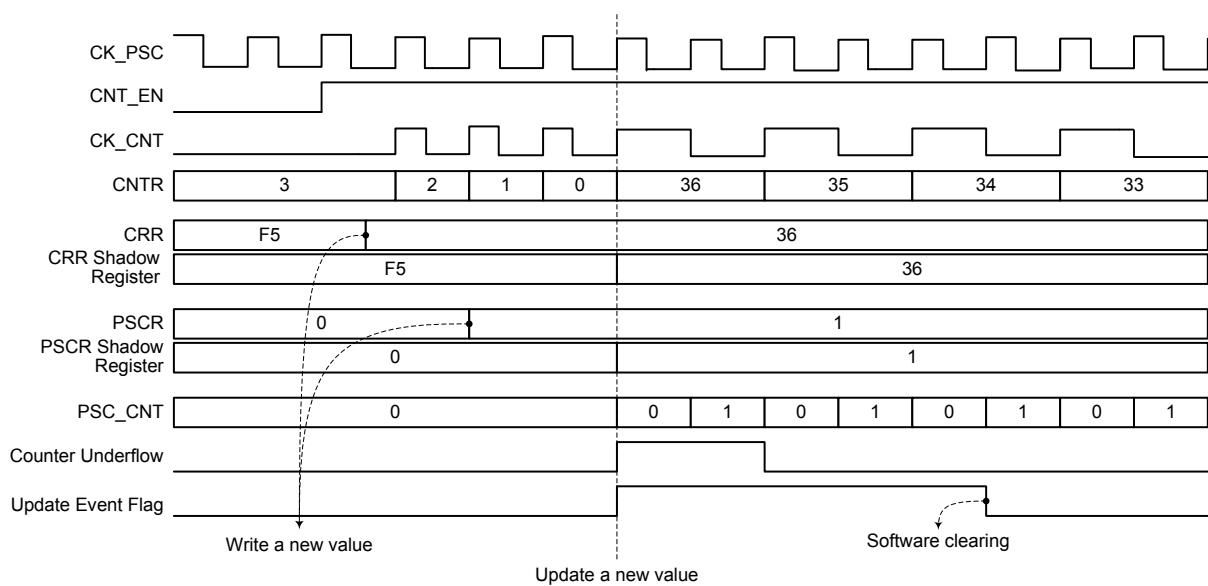

Figure 32. Down-counting Example

Center-Aligned Counting

In the center-aligned counting mode, the counter counts up from 0 to the counter-reload value and then counts down to 0 alternatively. The Timer module generates an overflow event when the counter counts to the counter-reload value in the up-counting mode and generates an underflow event when the counter counts to 0 in the down-counting mode. The counting direction bit DIR in the CNTCFR register is read-only and indicates the counting direction when in the center-aligned mode. The counting direction is updated by hardware automatically.

Setting the UEVG bit in the EVGR register will initialize the counter value to 0 irrespective of whether the counter is counting up or down in the center-aligned counting mode.

The UEVIF bit in the INTSR register will be set to 1 when an overflow or underflow event or both of them occur according to the CMSEL field setting in the CNTCFR register.

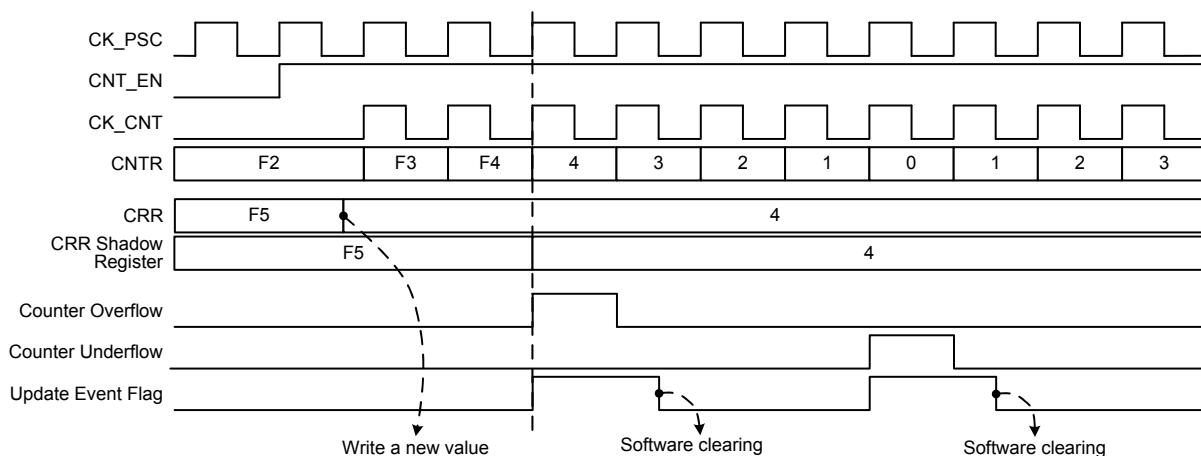

Figure 33. Center-aligned Counting Example

Clock Controller

The following describes the Timer Module clock controller which determines the clock source of the internal prescaler counter.

- Internal APB clock f_{CLKIN}

The default internal clock source is the APB clock f_{CLKIN} used to drive the counter prescaler when the slave mode is disabled. When the slave mode selection bits SMSEL in the MDCFR register are set to 0x4, 0x5 or 0x6, the internal APB clock f_{CLKIN} is the counter prescaler driving clock source. If the slave mode controller is enabled by setting SMSEL field in the MDCFR register to an available value including 0x1, 0x2, 0x3 and 0x7, the prescaler is clocked by other clock sources selected by the TRSEL field in the TRCFR register and described as follows.

- Quadrature Decoder

To select Quadrature Decoder mode the SMSEL field should be set to 0x1, 0x2 or 0x3 in the MDCFR register. The Quadrature Decoder function uses two input states of the GT_CH0 and GT_CH1 pins to generate the clock pulse to drive the counter prescaler. The counting direction bit DIR is modified by hardware automatically at each transition on the input source signal. The input source signal can be derived from the GT_CH0 pin only, the GT_CH1 pin only or both GT_CH0 and GT_CH1 pins.

- STIED

The counter prescaler can count during each rising edge of the STI signal. This mode can be selected by setting the SMSEL field to 0x7 in the MDCFR register. Here the counter will act as an event counter. The input event, known as STI here, can be selected by setting the TRSEL field to an available value except the value of 0x0. When the STI signal is selected as the clock source, the internal edge detection circuitry will generate a clock pulse during each STI signal rising edge to drive the counter prescaler. It is important to note that if the TRSEL field is set to 0x0 to select the software UEVG bit as the trigger source, then when the SMSEL field is set to 0x7, the counter will be updated instead of counting.

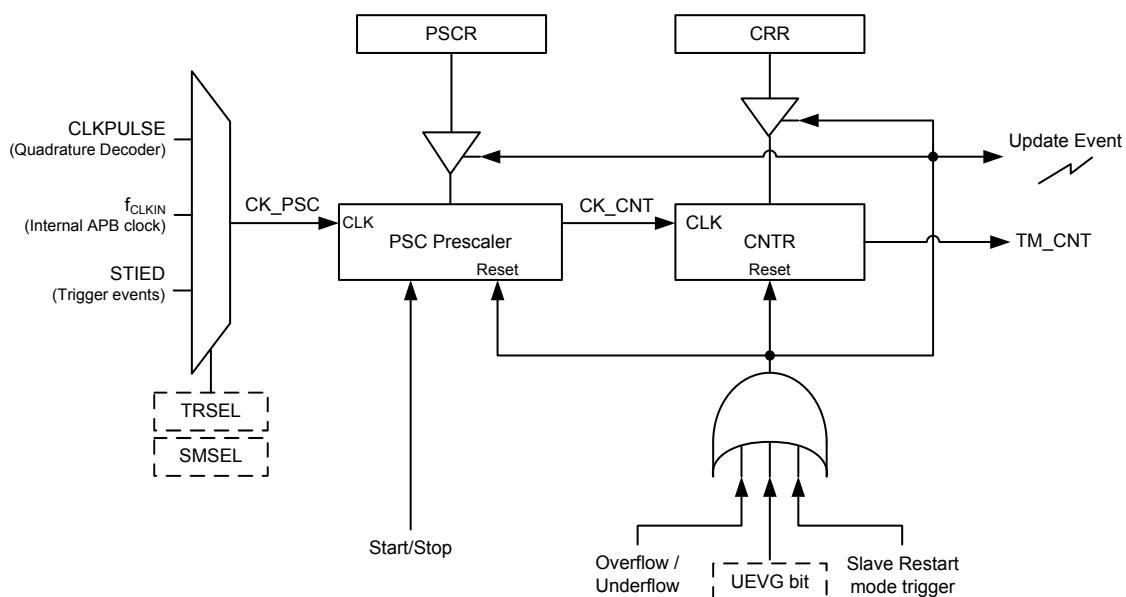

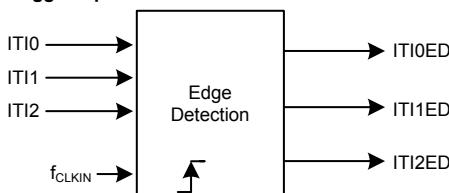

Figure 34. GPTM Clock Source Selection

Trigger Controller

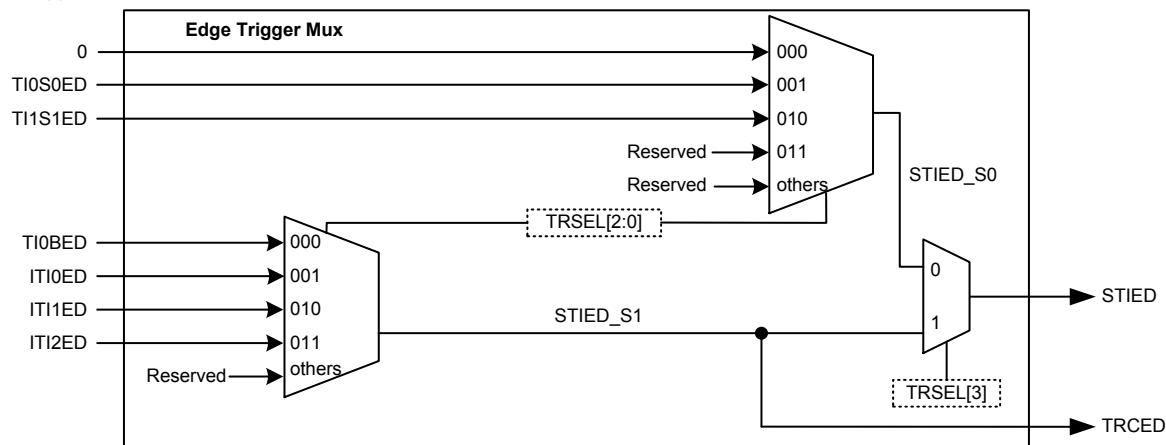

The trigger controller is used to select the trigger source and setup the trigger level or edge trigger condition. For the internal trigger input, it can be selected by the Trigger Selection bits TRSEL in the TRCFR register. For all the trigger sources except the UEVG bit software trigger, the internal edge detection circuitry will generate a clock pulse at each trigger signal rising edge to stimulate some GPTM functions which are triggered by a trigger signal rising edge.

Trigger Controller Block = Edge Trigger Mux + Level Trigger Mux

Internal Trigger Input

Edge Trigger Source = Internal (ITIx) + Channel input (TIn)

Level Trigger Source = Internal (ITIx) + Channel input (TIn) + Software UEVG bit

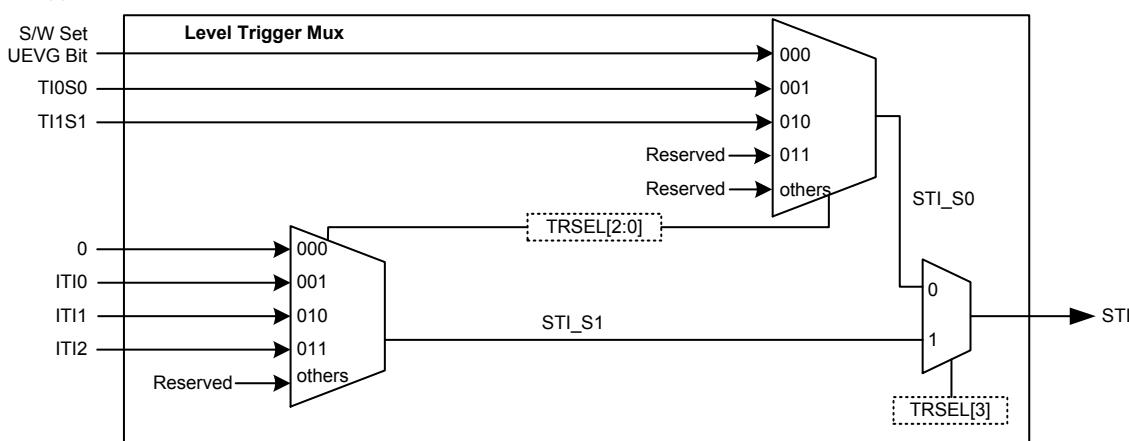

Figure 35. Trigger Controller Block

Slave Controller

The GPTM can be synchronized with an external trigger in several modes including the Restart mode, the Pause mode and the Trigger mode which can be selected by the SMSEL field in the MDCFR register. The trigger input of these modes comes from the STI signal which is selected by the TRSEL field in the TRCFR register. The operation modes in the Slave Controller are described in the accompanying sections.

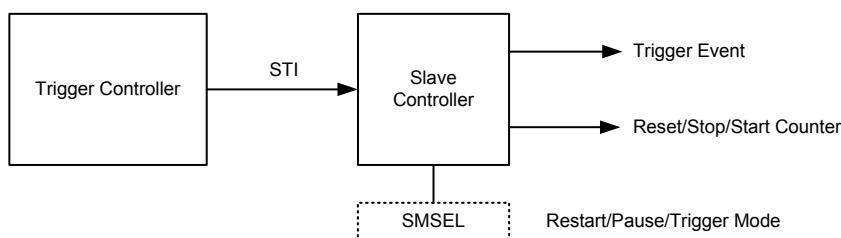

Figure 36. Slave Controller Diagram

Restart Mode

The counter and its prescaler can be reinitialized in response to a rising edge of the STI signal. When an STI rising edge occurs, the update event software generation bit named UEVG will automatically be asserted by hardware and the trigger event flag will also be set. Then the counter and prescaler will be reinitialized. Although the UEVG bit is set to 1 by hardware, the update event does not really occur. It depends upon whether the update event disable control bit UEVDIS is set to 1 or not. If the UEVDIS is set to 1 to disable the update event to occur, there will no update event be generated, however the counter and prescaler are still reinitialized when the STI rising edge occurs. If the UEVDIS bit in the CNTCFR register is cleared to enable the update event to occur, an update event will be generated together with the STI rising edge, then all the preloaded registers will be updated.

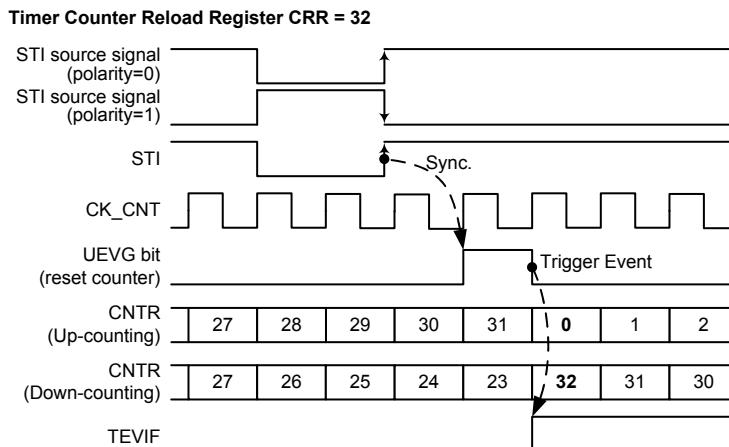

Figure 37. GPTM in Restart Mode

Pause Mode

In the Pause Mode, the selected STI input signal level is used to control the counter start / stop operation. The counter starts to count when the selected STI signal is at a high level and stops counting when the STI signal is changed to a low level, here the counter will maintain its present value and will not be reset. Since the Pause function depends upon the STI level to control the counter stop / start operation, the selected STI trigger signal can not be derived from the TI0BED signal.

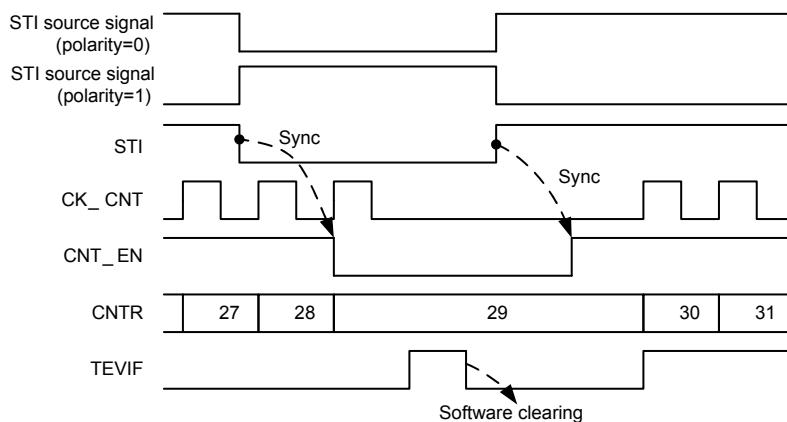

Figure 38. GPTM in Pause Mode

Trigger Mode

After the counter is disabled to count, the counter can resume counting when an STI rising edge signal occurs. When an STI rising edge occurs, the counter will start to count from the current value in the counter. Note that if the STI signal is selected to be derived from the UEVG bit software trigger, the counter will not resume counting. When software triggering using the UEVG bit is selected as the STI source signal, there will be no clock pulse generated which can be used to make the counter resume counting. Note that the STI signal is only used to enable the counter to resume counting and has no effect on controlling the counter to stop counting.

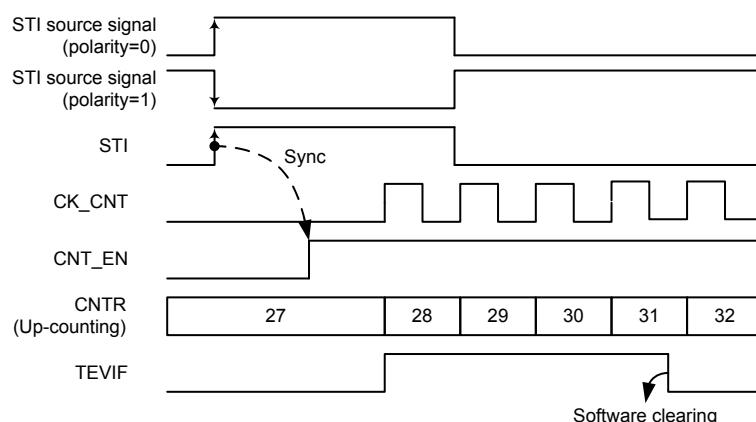

Figure 39. GPTM in Trigger Mode

Master Controller

The GPTMs and MCTMs can be linked together internally for timer synchronization or chaining. When one GPTM is configured to be in the Master Mode, the GPTM Master Controller will generate a Master Trigger Output (MTO) signal which includes a reset, a start, a stop signal or a clock source which is selected by the MMSEL field in the MDCFR register to trigger or drive another GPTM or MCTM, if exists, which is configured in the Slave Mode.

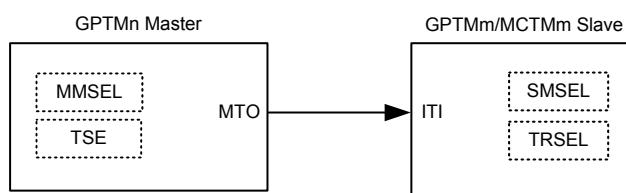

Figure 40. Master GPTMn and Slave GPTMm / MCTMm Connection

The Master Mode Selection bits, MMSEL, in the MDCFR register are used to select the MTO source for synchronizing another slave GPTM or MCTM if exists.

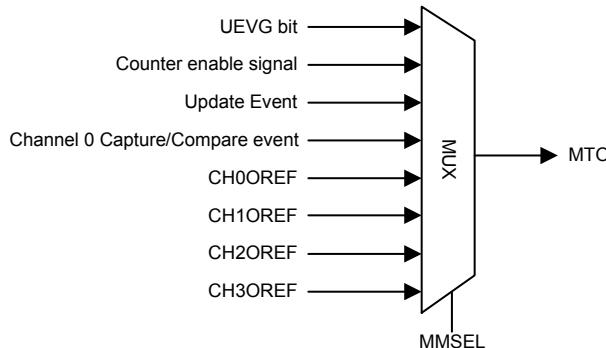

Figure 41. MTO Selection

For example, setting the MMSEL field to 0x5 is to select the CH1OREF signal as the MTO signal to synchronize another slave GPTM or MCTM. For a more detailed description, refer to the related MMSEL field definitions in the MDCFR register.

Channel Controller

The GPTM has four independent channels which can be used as capture inputs or compare match outputs. Each capture input or compare match output channel is composed of a preload register and a shadow register. Data access of the APB bus is always implemented by reading / writing the preload register.

When used in the input capture mode, the counter value is captured into the CHxCCR shadow register first and then transferred into the CHxCCR preload register when the capture event occurs.

When used in the compare match output mode, the contents of the CHxCCR preload register is copied into the associated shadow register, the counter value is then compared with the register value.

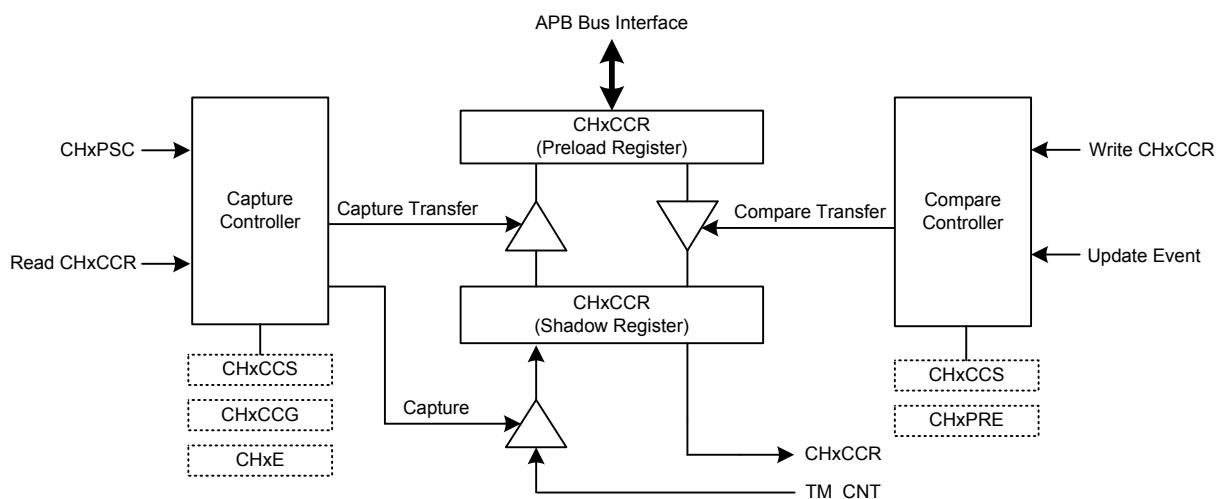

Figure 42. Capture / Compare Block Diagram

Capture Counter Value Transferred to CHxCCR

When the channel is used as a capture input, the counter value is captured into the Channel Capture / Compare Register (CHxCCR) when an effective input signal transition occurs. Once the capture event occurs, the CHxCCIF flag in the INTSR register is set accordingly. If the CHxCCIF bit is already set, i.e., the flag has not yet been cleared by software, and another capture event on this channel occurs, the corresponding channel Over-Capture flag, named CHxOCF, will be set.

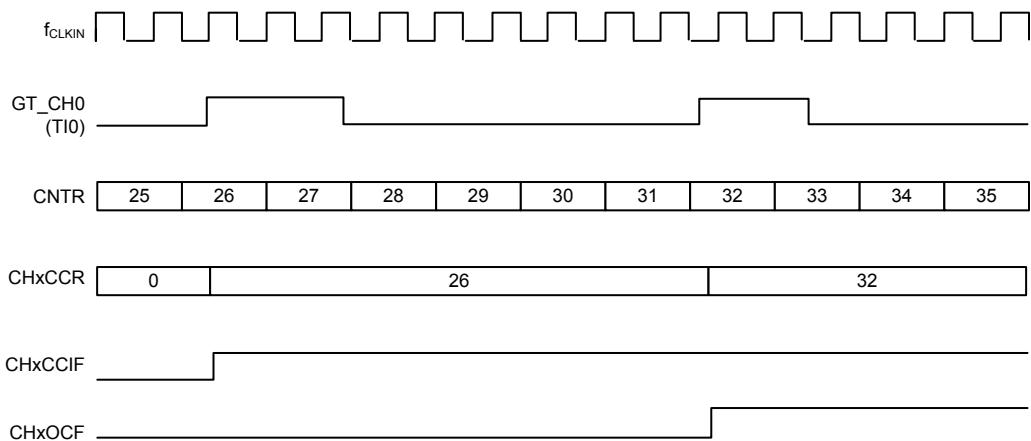

Figure 43. Input Capture Mode

Pulse Width Measurement

The input capture mode can be also used for pulse width measurement from signals on the GT_CHx pins, TIx. The following example shows how to configure the GPTM operated in the input capture mode to measure the high pulse width and the input period on the GT_CH0 pin using channel 0 and channel 1. The basic steps are shown as follows.

- Configure the capture channel 0 (CH0CCS = 0x1) to select the TI0 signal as the capture input.
- Configure the CH0P bit to 0 to choose the rising edge of the TI0 input as the active polarity.
- Configure the capture channel 1 (CH1CCS = 0x2) to select the TI0 signal as the capture input.
- Configure the CH1P bit to 1 to choose the falling edge of the TI0 input as the active polarity.
- Configure the TRSEL bits to 0x1 to select TI0S0 as the trigger input.
- Configure the Slave controller to operate in the Restart mode by setting the SMSEL field in the MDCFR register to 0x4.
- Enable the input capture mode by setting the CH0E and CH1E bits in the CHCTR register to 1.

As the following diagram shows, the high pulse width on the GT_CH0 pin will be captured into the CH1CCR register while the input period will be captured into the CH0CCR register after input capture operation.

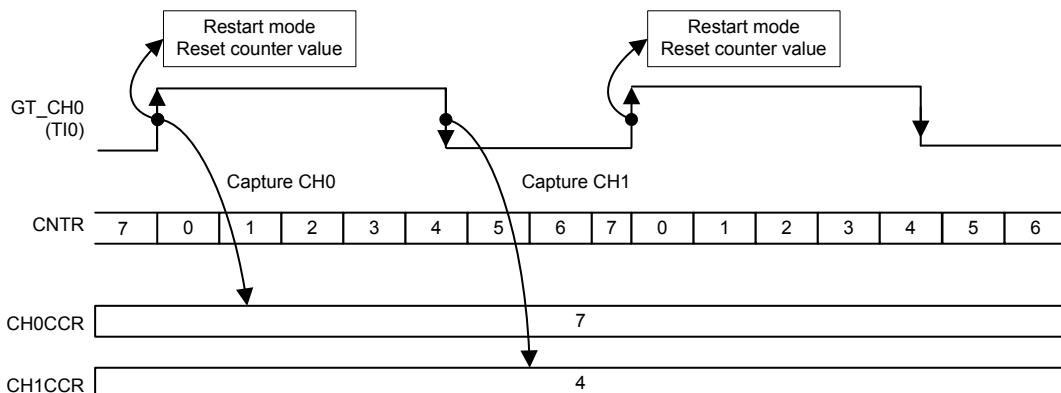

Figure 44. PWM Pulse Width Measurement Example

Input Stage

The input stage consists of a digital filter, a channel polarity selection, edge detection and a channel prescaler. The channel 0 input signal (TI0) can be chosen to come from the GT_CH0 signal or the Exclusive-OR function of the GT_CH0, GT_CH1 and GT_CH2 signals. The channel input signal (TIx) is sampled by a digital filter to generate a filtered input signal TIxFP. Then the channel polarity and the edge detection block can generate a TIxS0ED or TIxS1ED signal for the input capture function. The effective input event number can be set by the channel capture input source prescaler setting field (CHxPSC).

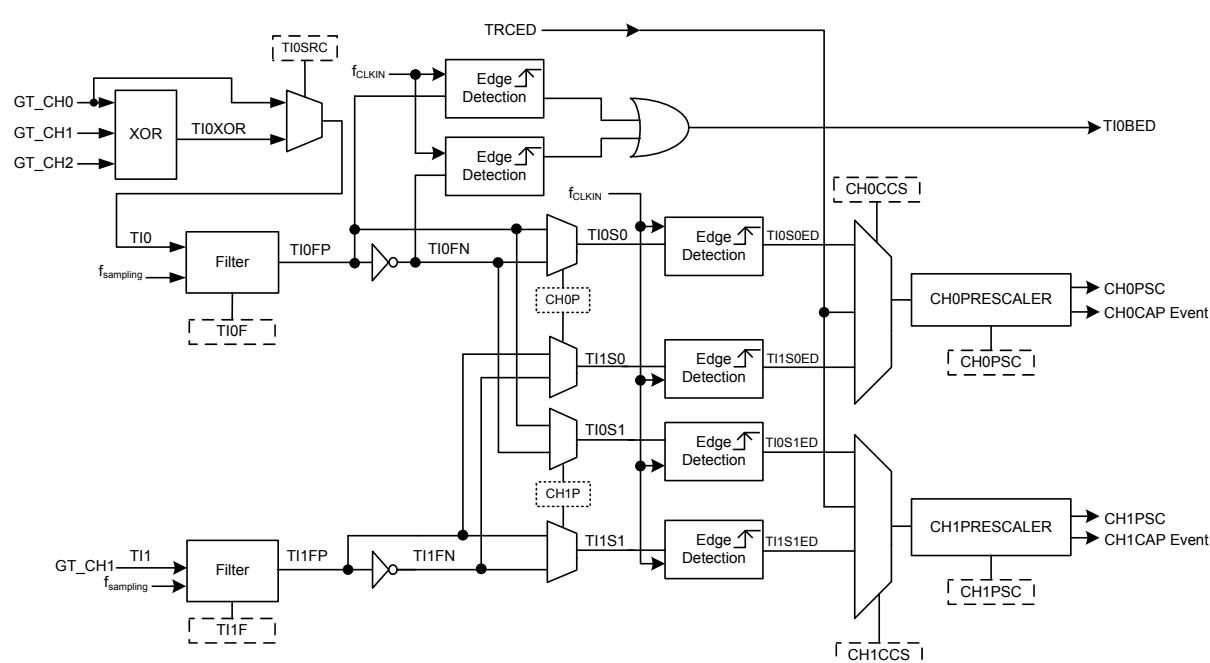

Figure 45. Channel 0 and Channel 1 Input Stages

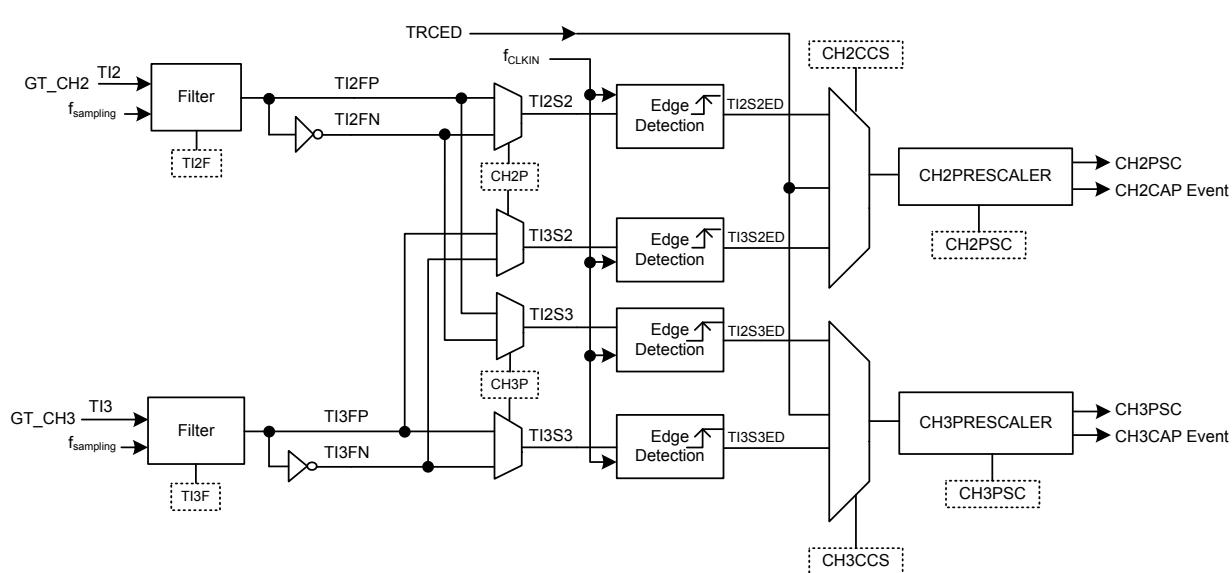

Figure 46. Channel 2 and Channel 3 Input Stages

Digital Filter

The digital filters are embedded in the input stage for the GT_CH0 ~ GT_CH3 pins respectively. The digital filter in the GPTM is an N-event counter where N refers to how many valid transitions are necessary to output a filtered signal. The N value can be 0, 2, 4, 5, 6 or 8 according to the user selection for each filter.

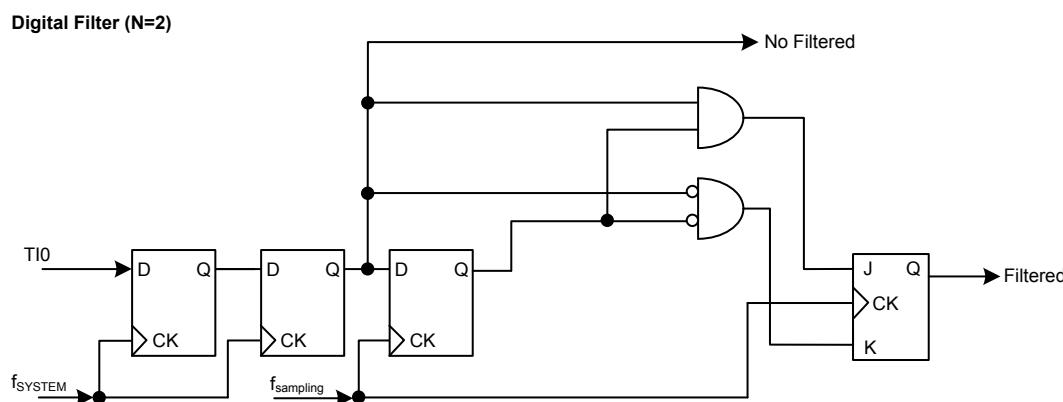

Figure 47. TI0 Digital Filter Diagram with N = 2

Quadrature Decoder

The Quadrature Decoder function uses two quadrantal inputs TI0 and TI1 derived from the GT_CH0 and GT_CH1 pins respectively to interact to generate the counter value. The DIR bit is modified by hardware automatically during each input source transition. The input source can be either TI0 only, TI1 only or both TI0 and TI1, the selection made by setting the SMSEL field to 0x1, 0x2 or 0x3. The mechanism for changing the counter direction is shown in the following table. The Quadrature decoder can be regarded as an external clock with a directional selection. This means that the counter counts continuously in the interval between 0 and the counter-reload value. Therefore, users must configure the CRR register before the counter starts to count.

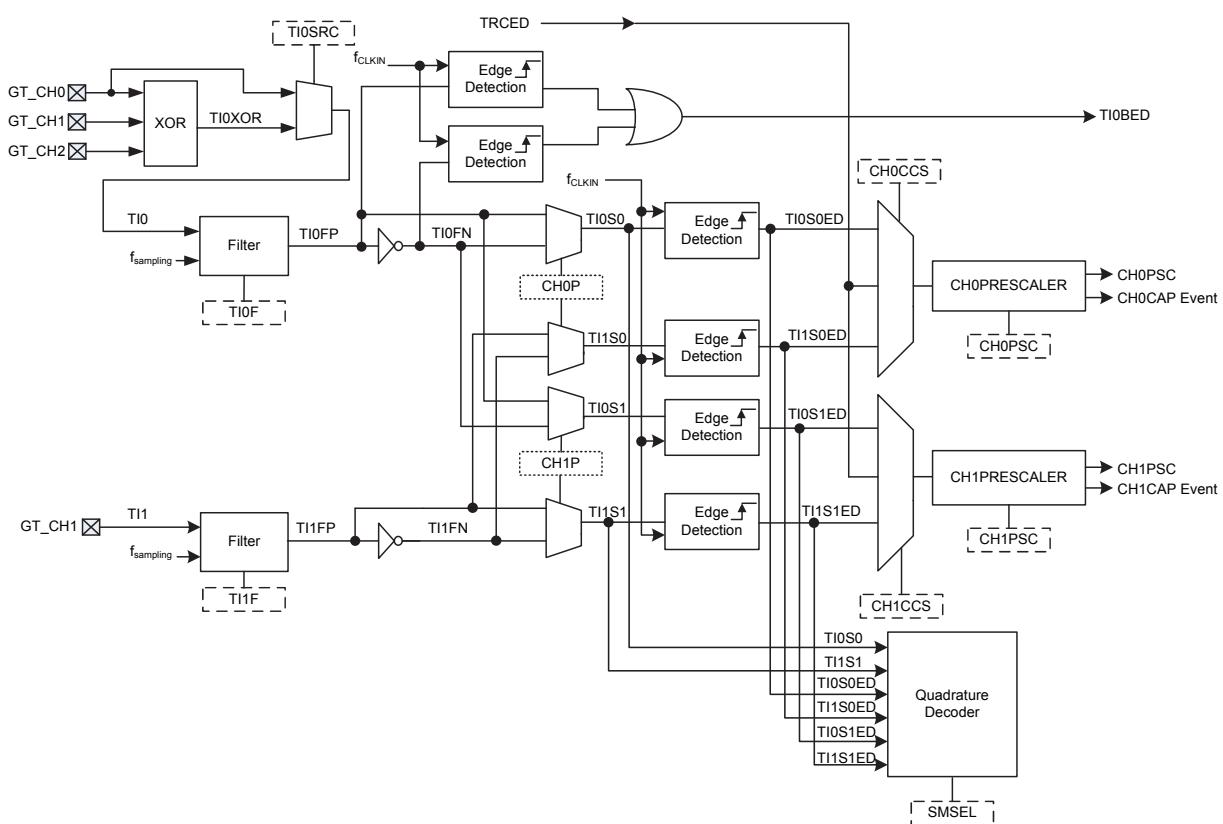

Figure 48. Input Stage and Quadrature Decoder Block Diagram

Table 26. Counting Direction and Encoding Signals

Counting Mode	Level	TI0S0		TI1S1	
		Rising	Falling	Rising	Falling
Counting on TI0 only (SMSEL = 0x1)	TI1S1 = High	Down	Up	—	—
	TI1S1 = Low	Up	Down	—	—
Counting on TI1 only (SMSEL = 0x2)	TI0S0 = High	—	—	Up	Down
	TI0S0 = Low	—	—	Down	Up
Counting on TI0 and TI1 (SMSEL = 0x3)	TI1S1 = High	Down	Up	X	X
	TI1S1 = Low	Up	Down	X	X
	TI0S0 = High	X	X	Up	Down
	TI0S0 = Low	X	X	Down	Up

Note: “—” → “no counting”; “X” → impossible

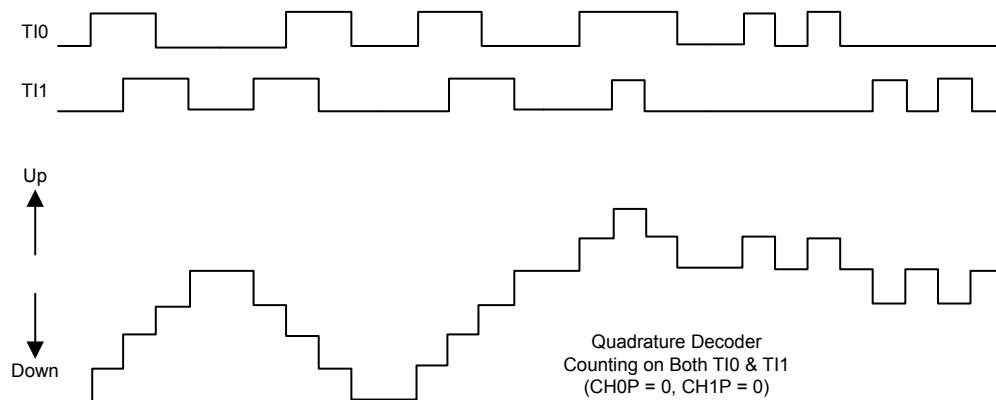

Figure 49. Both TI0 and TI1 Quadrature Decoder Counting

Output Stage

The GPTM has four channels for compare match, single pulse or PWM output function. The channel output GT_CHxO is controlled by the CHxOM, CHxP and CHxE bits in the corresponding CHxOCFR, CHPOLR and CHCTR registers.

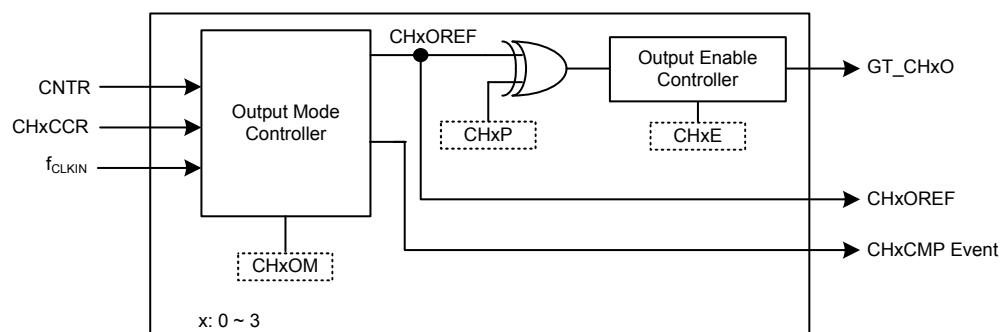

Figure 50. Output Stage Block Diagram

Channel Output Reference Signal

When the GPTM is used in the compare match output mode, the CHxOREF signal (Channel x Output Reference signal) is defined by the CHxOM field setup. The CHxOREF signal has several types of output function which defines what happens to the output when the counter value matches the contents of the CHxCCR register. In addition to the low, high and toggle CHxOREF output types; there are also PWM mode 1 and PWM mode 2 outputs. In these modes, the CHxOREF signal level is changed according to the count direction and the relationship between the counter value and the CHxCCR content. There are also two modes which will force the output into an inactive or active state irrespective of the CHxCCR content or counter values. With regard to a more detailed description refer to the relative bit definition. The accompanying Table 27 shows a summary of the output type setup.

Table 27. Compare Match Output Setup

CHxOM Value	Compare Match Level
0x0	No change
0x1	Clear Output to 0
0x2	Set Output to 1
0x3	Toggle Output
0x4	Force Inactive Level
0x5	Force Active Level
0x6	PWM Mode 1
0x7	PWM Mode 2

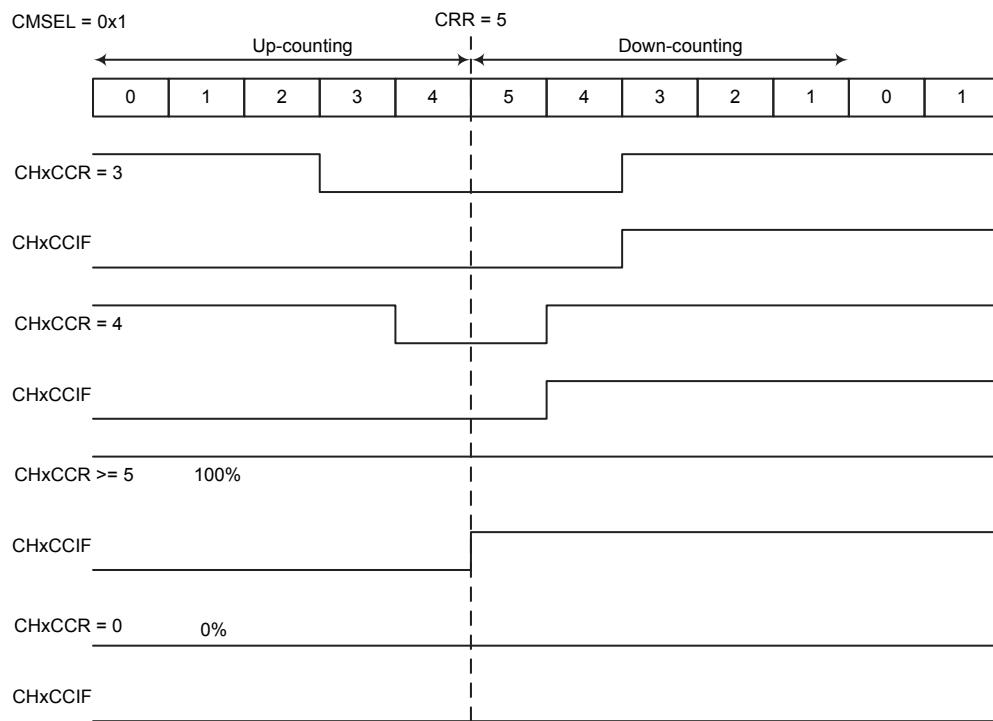

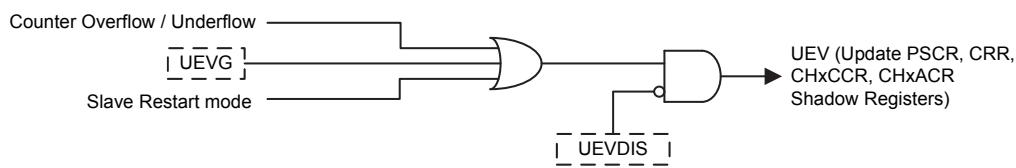

Figure 55. PWM Mode Channel Output Reference Signal and Counter in Centre-aligned Mode

Update Management

The Update event is used to update the CRR, the PSCR, the CHxACR and the CHxCCR values from the actual registers to the corresponding shadow registers. An update event occurs when the counter overflows or underflows, the software update control bit is triggered or an update event from the slave controller is generated.

The UEVDIS bit in the CNTCFR register can determine whether the update event occurs or not. When the update event occurs, the corresponding update event interrupt will be generated depending upon whether the update event interrupt generation function is enabled or not by configuring the UGDIS bit in the CNTCFR register. For more detail description, refer to the UEVDIS and UGDIS bit definition in the CNTCFR register.

Update Event Management

Update Event Interrupt Management

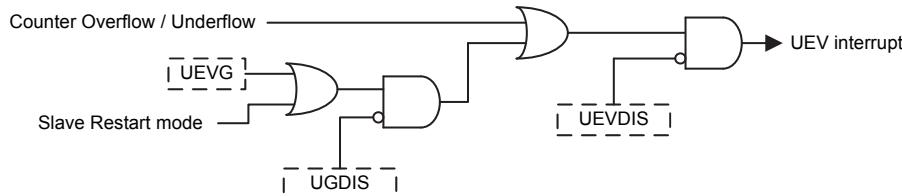

Figure 56. Update Event Setting Diagram

Single Pulse Mode

Once the timer is set to operate in the single pulse mode, it is not necessary to set the timer enable bit TME in the CTR register to 1 to enable the counter. The trigger to generate a pulse can be sourced from the STI signal rising edge or by setting the TME bit to 1 using software. Setting the TME bit to 1 or a trigger from the STI signal rising edge can generate a pulse and then keep the TME bit at a high state until the update event occurs or the TME bit is written to 0 by software. If the TME bit is cleared to 0 using software, the counter will be stopped and its value held. If the TME bit is automatically cleared to 0 by a hardware update event, the counter will be reinitialized.

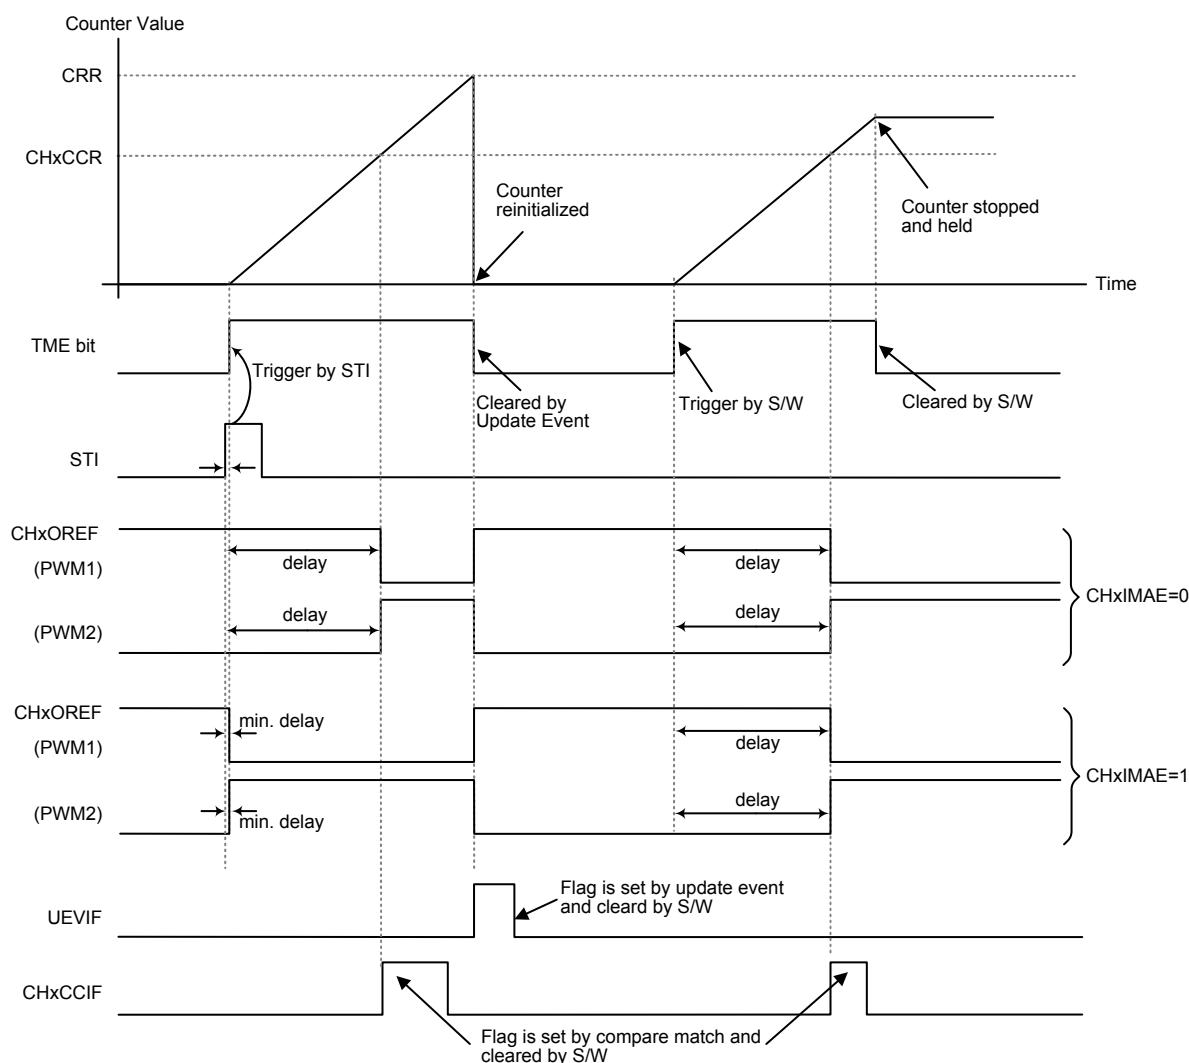

Figure 57. Single Pulse Mode

In the Single Pulse mode, the STI active edge which sets the TME bit to 1 will enable the counter. However, there exist several clock delays to perform the comparison result between the counter value and the CHxCCR value. In order to reduce the delay to a minimum value, the user can set the CHxIMAE bit in each CHxOCFR register. After an STI rising edge trigger occurs in the single pulse mode, the CHxOREF signal will immediately be forced to the state which the CHxOREF signal will change to as the compare match event occurs without taking the comparison result into account. The CHxIMAE bit is available only when the output channel is configured to operate in the PWM mode 1 or PWM mode 2 and the trigger source is derived from the STI signal.

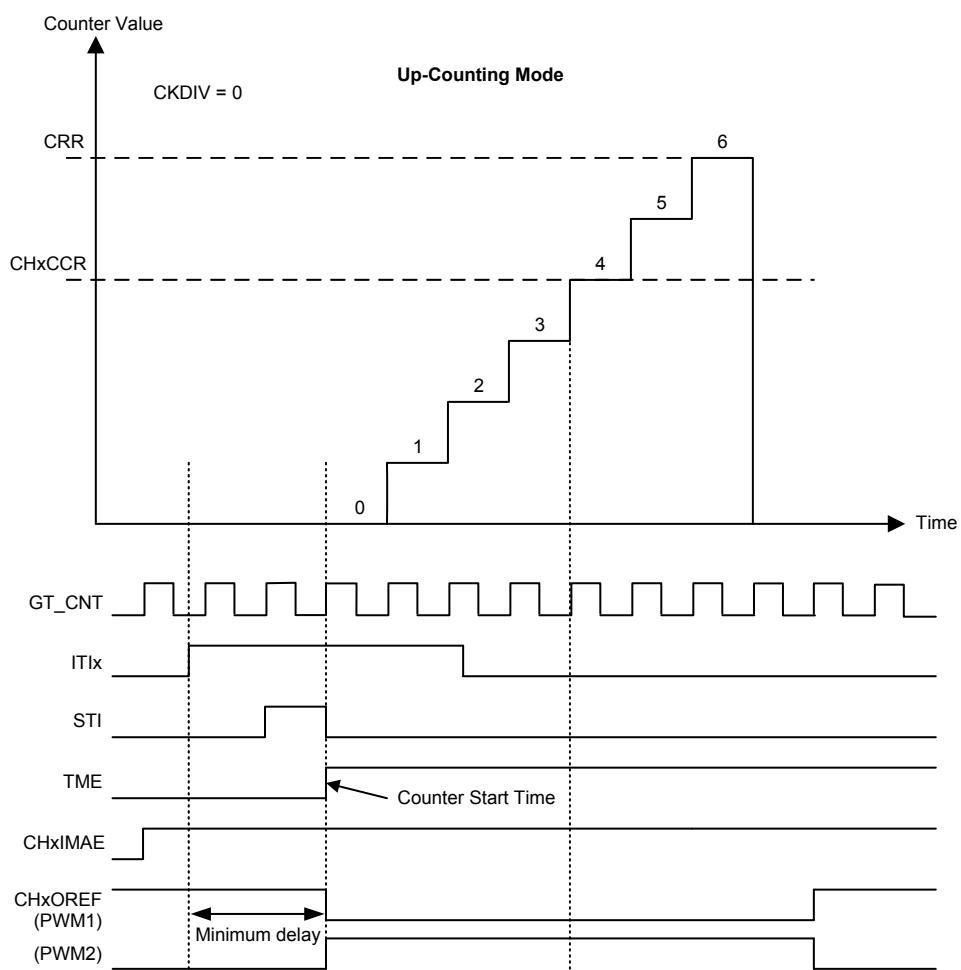

Figure 58. Immediate Active Mode Minimum Delay

Asymmetric PWM Mode

Asymmetric PWM mode allows two center-aligned PWM signals to be generated with a programmable phase shift. While the PWM frequency is determined by the value of the CRR register, the duty cycle and the phase-shift are determined by the CHxCCR and CHxACR register. When the counter is counting up, the PWM uses the value in CHxCCR as up-count compare value. When the counter is into counting down stage, the PWM uses the value in CHxACR as down-count compare value. The Figure 59 is shown as an example for asymmetric PWM mode in center-aligned counting mode.

Note: Asymmetric PWM mode can only be operated in center-aligned counting mode.

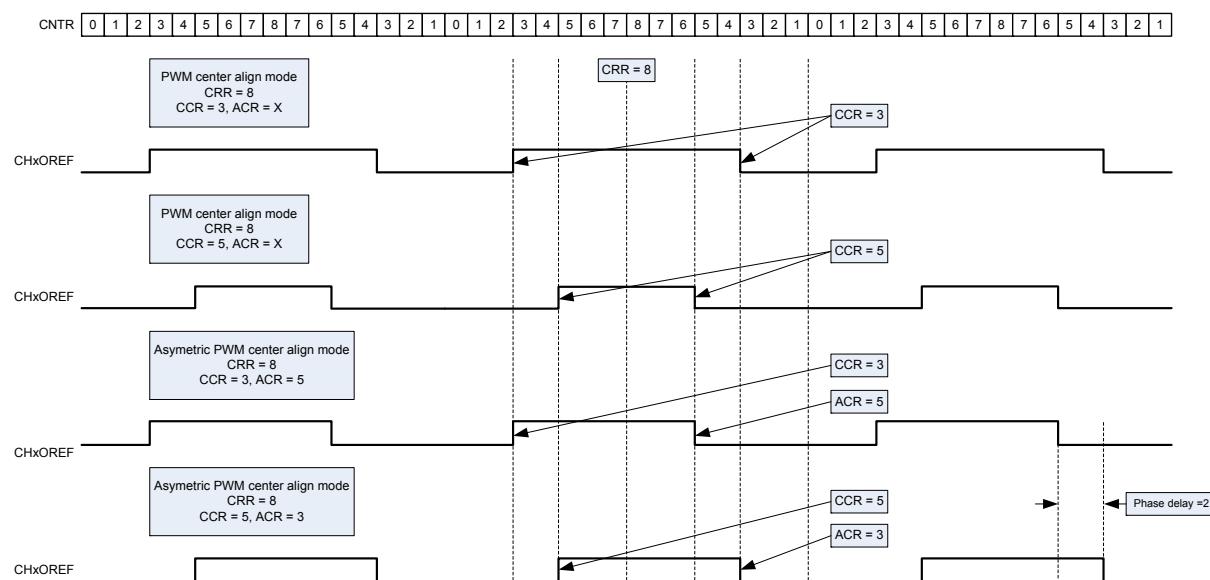

Figure 59. Asymmetric PWM Mode versus Center-aligned Counting Mode

Timer Interconnection

The timers can be internally connected together for timer chaining or synchronization. This can be implemented by configuring one timer to operate in the Master mode while configuring another timer to be in the Slave mode. The following figures present several examples of trigger selection for the master and slave modes.

Using One Timer to Enable / Disable Another Timer Start or Stop Counting

- Configure GPTM as the master mode to send its channel 0 Output Reference signal CH0OREF as a trigger output (MMSEL = 0x4).
- Configure GPTM CH0OREF waveform.
- Configure PWM0 to receive its input trigger source from the GPTM trigger output (TRSEL = 0xA).
- Configure PWM0 to operate in the pause mode (SMSEL = 0x5).
- Enable PWM0 by writing ‘1’ to the TME bit.
- Enable GPTM by writing ‘1’ to the TME bit.

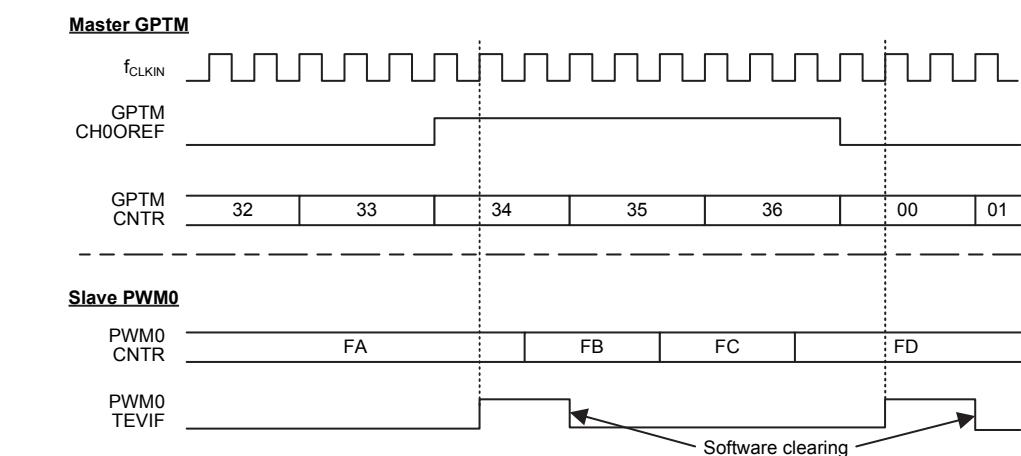

Figure 60. Pausing PWM0 using the GPTM CH0OREF Signal

Using One Timer to Trigger Another Timer Start Counting

- Configure GPTM to operate in the master mode to send its Update Event UEV as the trigger output (MMSEL = 0x2).
- Configure the GPTM period by setting the CRR register.
- Configure PWM0 to get the input trigger source from the GPTM trigger output (TRSEL = 0xA).
- Configure PWM0 to be in the slave trigger mode (SMSEL = 0x6).
- Start GPTM by writing ‘1’ to the TME bit.

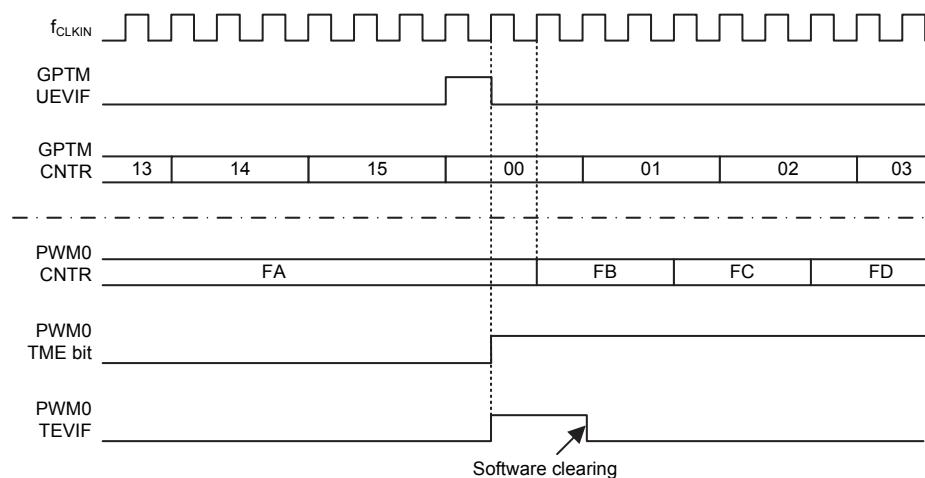

Figure 61. Triggering PWM0 with GPTM Update Event

Starting Two Timers Synchronously in Response to an External Trigger

- Configure GPTM to operate in the master mode to send its enable signal as a trigger output (MMSEL = 0x1).
- Configure GPTM slave mode to receive its input trigger source from GT_CH0 pin (TRSEL = 0x1).
- Configure GPTM to be in the slave trigger mode (SMSEL = 0x6).
- Enable the GPTM master timer synchronization function by setting the TSE bit in the MDCFR register to 1 to synchronize the slave timer.
- Configure PWM0 to receive its input trigger source from the GPTM trigger output (TRSEL = 0xA).
- Configure PWM0 to be in the slave trigger mode (SMSEL = 0x6).

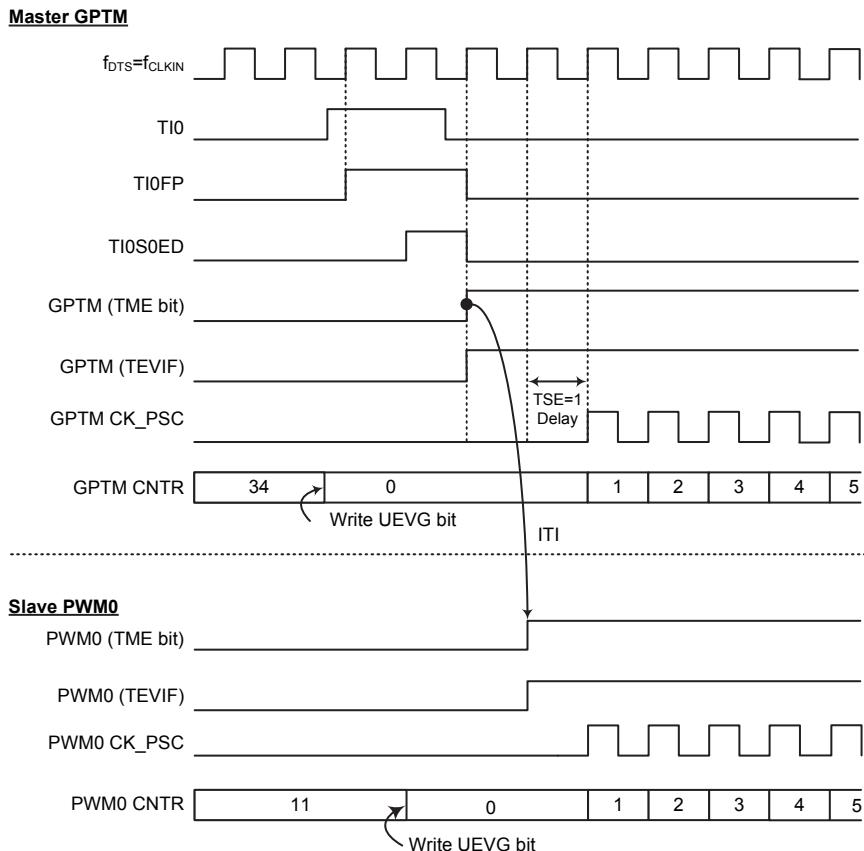

Figure 62. Trigger GPTM and PWM0 with the GPTM CH0 Input

Trigger ADC Start

To interconnect to the Analog-to-Digital Converter, the GPTM can output the MTO signal or the channel compare match output signal CHxOREF ($x = 0 \sim 3$) to be used as an Analog-to-Digital Converter input trigger signal.

Register Map

The following table shows the GPTM registers and reset values.

Table 28. GPTM Register Map

Register	Offset	Description	Reset Value
CNTCFR	0x000	Timer Counter Configuration Register	0x0000_0000
MDCFR	0x004	Timer Mode Configuration Register	0x0000_0000
TRCFR	0x008	Timer Trigger Configuration Register	0x0000_0000
CTR	0x010	Timer Control Register	0x0000_0000

CH1ACR	0x0A4	Channel 1 Asymmetric Compare Register	0x0000_0000
CH2ACR	0x0A8	Channel 2 Asymmetric Compare Register	0x0000_0000
CH3ACR	0x0AC	Channel 3 Asymmetric Compare Register	0x0000_0000

Register Descriptions

Timer Counter Configuration Register – CNTCFR

This register specifies the GPTM counter configuration.

Offset: 0x000

Reset value: 0x0000_0000

Type/Reset	31	30	29	28	27	26	25	24	
	Reserved								DIR
Type/Reset	23	22	21	20	19	18	17	16	
	Reserved								CMSEL
Type/Reset	15	14	13	12	11	10	9	8	
	Reserved								CKDIV
Type/Reset	7	6	5	4	3	2	1	0	
	Reserved								UGDIS UEVDIS

Bits	Field	Descriptions
[24]	DIR	Counting Direction 0: Count-up 1: Count-down Note: This bit is read only when the Timer is configured to be in the Center-aligned mode or when used as a Quadrature decoder.
[17:16]	CMSEL	Counter Mode Selection 00: Edge-aligned mode. Normal up-counting and down-counting available for this mode. Counting direction is defined by the DIR bit 01: Center-aligned mode 1. The counter counts up and down alternatively. The compare match interrupt flag is set during the count-down period 10: Center-aligned mode 2. The counter counts up and down alternatively. The compare match interrupt flag is set during the count-up period 11: Center-aligned mode 3. The counter counts up and down alternatively. The compare match interrupt flag is set during the count-up and count-down period
[9:8]	CKDIV	Clock Division These two bits define the frequency ratio between the timer clock (f_{CLKIN}) and the dead-time clock (f_{DTS}). The dead-time clock is also used for digital filter sampling clock. 00: $f_{DTS} = f_{CLKIN}$ 01: $f_{DTS} = f_{CLKIN} / 2$ 10: $f_{DTS} = f_{CLKIN} / 4$ 11: Reserved
[1]	UGDIS	Update event interrupt generation disable control 0: Any of the following events will generate an update interrupt - Counter overflow / underflow - Setting the UEVG bit - Update generation through the slave mode 1: Only counter overflow / underflow generates an update interrupt

Bits	Field	Descriptions
[0]	UEVDIS	<p>Update event Disable control</p> <p>0: Enable the update event request by one of following events:</p> <ul style="list-style-type: none"> - Counter overflow / underflow - Setting the UEVG bit - Update generation through the slave mode <p>1: Disable the update event (However the counter and the prescaler are reinitialized if the UEVG bit is set or if a hardware restart is received from the slave mode)</p>

Timer Mode Configuration Register – MDCFR

This register specifies the GPTM master and slave mode selection and single pulse mode.

Offset: 0x004

Reset value: 0x0000_0000

31	30	29	28	27	26	25	24

		111	STIED
[0]	TSE	Timer Synchronization Enable	
		0: No action 1: Master timer (current timer) will generate a delay to synchronize its slave timer through the MTO signal	

Timer Trigger Configuration Register – TRCFR

This register specifies the trigger source selection of GPTM.

Offset: 0x008

Reset value: 0x0000_0000

Bits	Field	Descriptions
[3:0]	TRSEL	<p>Trigger Source Selection</p> <p>These bits are used to select the trigger input (STI) for counter synchronization.</p> <ul style="list-style-type: none"> 0000: Software Trigger by setting the UEVG bit 0001: Filtered input of channel 0 (TI0S0) 0010: Filtered input of channel 1 (TI1S1) 0011: Reserved 1000: Channel 0 Edge Detector (TI0BED) 1001: Internal Timing Module Trigger 0 (ITI0) 1010: Internal Timing Module Trigger 1 (ITI1) 1011: Internal Timing Module Trigger 2 (ITI2) Others: Reserved <p>Note: These bits must be updated only when they are not in use, i.e. the slave mode is disabled by setting the SMSEL field to 0x0.</p>

Table 29. GPTM Internal Trigger Connection

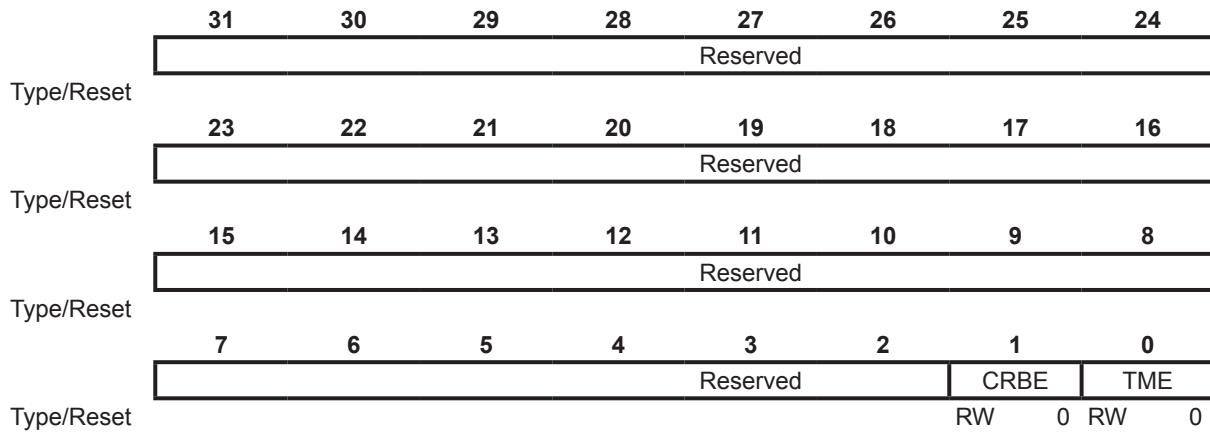

Slave Timing Module	ITI0	ITI1	ITI2
GPTM	PWM0	—	PWM1

Timer Counter Register – CTR

This register specifies the timer enable bit (TME) and CRR buffer enable bit (CRBE).

Offset: 0x010

Reset value: 0x0000_0000

Bits	Field	Descriptions
[1]	CRBE	Counter Reload register Buffer Enable 0: Counter reload register can be updated immediately 1: Counter reload register can not be updated until the update event occurs
[0]	TME	Timer Enable bit 0: GPTM off 1: GPTM on – GPTM functions normally When the TME bit is cleared to 0, the counter is stopped and the GPTM consumes no power in any operation mode except for the single pulse mode and the slave trigger mode. In these two modes the TME bit can automatically be set to 1 by hardware which permits all the GPTM registers to function normally.

Channel 0 Input Configuration Register – CH0ICFR

This register specifies the channel 0 input mode configuration.

Offset: 0x020

Reset value: 0x0000_0000

Channel 2 Output Configuration Register – CH2OCFR

This register specifies the channel 2 output mode configuration.

Offset: 0x048

Reset value: 0x0000_0000

Bits	Field	Descriptions
[5]	CH2IMAE	<p>Channel 2 Immediate Active Enable</p> <p>0: No action</p> <p>1: Single pulse Immediate Active Mode is enabled</p> <p>The CH2OREF will be forced to the compare matched level immediately after an available trigger event occurs irrespective of the result of the comparison between the CNTR and the CH2CCR values.</p> <p>The effective duration ends automatically at the next overflow or underflow event.</p> <p>Note: The CH2IMAE bit is available only if the channel 2 is configured to be operated in the PWM mode 1 or the PWM mode 2.</p>
[4]	CH2PRE	<p>Channel 2 Capture / Compare Register (CH2CCR) Preload Enable</p> <p>0: CH2CCR preload function is disabled</p> <p>The CH2CCR register can be immediately assigned a new value when the CH2PRE bit is cleared to 0 and the updated CH2CCR value is used immediately.</p> <p>1: CH2CCR preload function is enabled</p> <p>The new CH2CCR value will not be transferred to its shadow register until the update event occurs.</p>

Bits	Field	Descriptions
[8][2:0]	CH2OM[3:0]	<p>Channel 2 Output Mode Setting</p> <p>These bits define the functional types of the output reference signal CH2OREF.</p> <ul style="list-style-type: none"> 0000: No Change 0001: Output 0 on compare match 0010: Output 1 on compare match 0011: Output toggles on compare match 0100: Force inactive – CH2OREF is forced to 0 0101: Force active – CH2OREF is forced to 1 0110: PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 2 has an active level when CNTR < CH2CCR or otherwise has an inactive level. - During down-counting, channel 2 has an inactive level when CNTR > CH2CCR or otherwise has an active level. 0111: PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 2 has an inactive level when CNTR < CH2CCR or otherwise has an active level. - During down-counting, channel 2 has an active level when CNTR > CH2CCR or otherwise has an inactive level. 1110: Asymmetric PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 2 has an active level when CNTR < CH2CCR or otherwise has an inactive level. - During down-counting, channel 2 has an inactive level when CNTR > CH2ACR or otherwise has an active level. 1111: Asymmetric PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 2 has an inactive level when CNTR < CH2CCR or otherwise has an active level. - During down-counting, channel 2 has an active level when CNTR > CH2ACR or otherwise has an inactive level

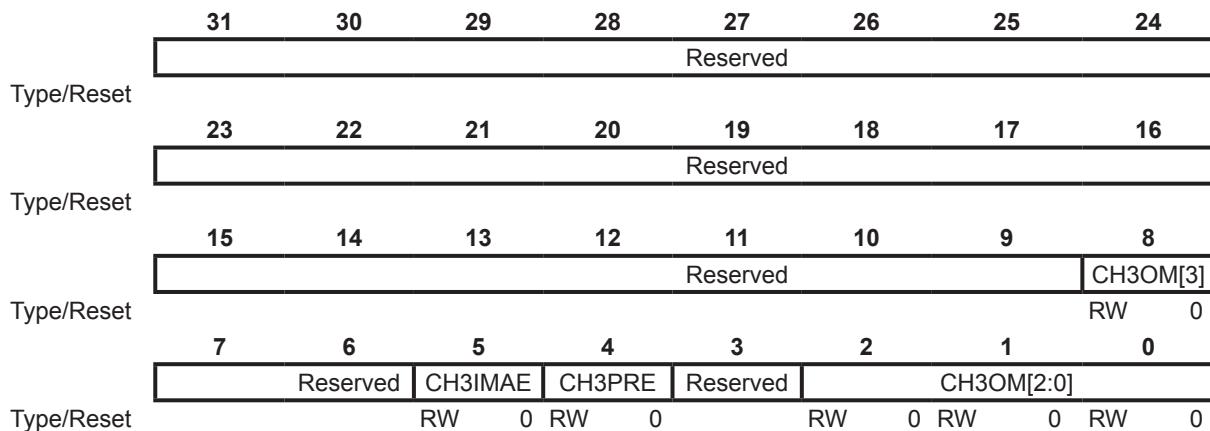

Note: When channel 2 is used as asymmetric PWM output mode, the Counter Mode Selection bit in Counter Configuration Register must be configured as Center-aligned Counting mode (CMSEL = 0x1 / 0x2 / 0x3)

Channel 3 Output Configuration Register – CH3OCFR

This register specifies the channel 3 output mode configuration.

Offset: 0x04C

Reset value: 0x0000_0000

Bits	Field	Descriptions
[5]	CH3IMAE	<p>Channel 3 Immediate Active Enable</p> <p>0: No action</p> <p>1: Single pulse Immediate Active Mode is enabled</p> <p>The CH3OREF will be forced to the compare matched level immediately after an available trigger event occurs irrespective of the result of the comparison between the CNTR and the CH3CCR values.</p> <p>The effective duration ends automatically at the next overflow or underflow event.</p> <p>Note: The CH3IMAE bit is available only if the channel 3 is configured to be operated in the PWM mode 1 or the PWM mode 2.</p>
[4]	CH3PRE	<p>Channel 3 Capture / Compare Register (CH3CCR) Preload Enable</p> <p>0: CH3CCR preload function is disabled</p> <p>The CH3CCR register can be immediately assigned a new value when the CH3PRE bit is cleared to 0 and the updated CH3CCR value is used immediately.</p> <p>1: CH3CCR preload function is enabled</p> <p>The new CH3CCR value will not be transferred to its shadow register until the update event occurs.</p>

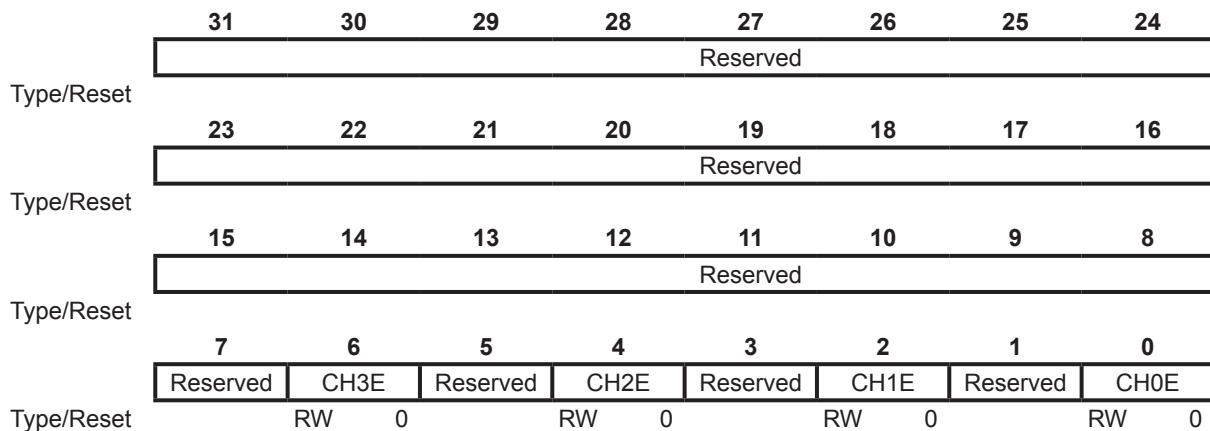

Bits	Field	Descriptions
[8][2:0]	CH3OM[3:0]	<p>Channel 3 Output Mode Setting</p> <p>These bits define the functional types of the output reference signal CH3OREF</p> <ul style="list-style-type: none"> 0000: No Change 0001: Output 0 on compare match 0010: Output 1 on compare match 0011: Output toggles on compare match 0100: Force inactive – CH3OREF is forced to 0 0101: Force active – CH3OREF is forced to 1 0110: PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 3 has an active level when CNTR < CH3CCR or otherwise has an inactive level. - During down-counting, channel 3 has an inactive level when CNTR > CH3CCR or otherwise has an active level. 0111: PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 3 has an inactive level when CNTR < CH3CCR or otherwise has an active level. - During down-counting, channel 3 has an active level when CNTR > CH3CCR or otherwise has an inactive level 1110: Asymmetric PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 3 has an active level when CNTR < CH3CCR or otherwise has an inactive level. - During down-counting, channel 3 has an inactive level when CNTR > CH3ACR or otherwise has an active level. 1111: Asymmetric PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 3 has an inactive level when CNTR < CH3CCR or otherwise has an active level. - During down-counting, channel 3 has an active level when CNTR > CH3ACR or otherwise has an inactive level <p>Note: When channel 3 is used as asymmetric PWM output mode, the Counter Mode Selection bit in Counter Configuration Register must be configured as Center-aligned Counting mode (CMSEL = 0x1 / 0x2 / 0x3)</p>

Channel Control Register – CHCTR

This register contains the channel capture input or compare output function enable control bits.

Offset: 0x050

Reset value: 0x0000_0000

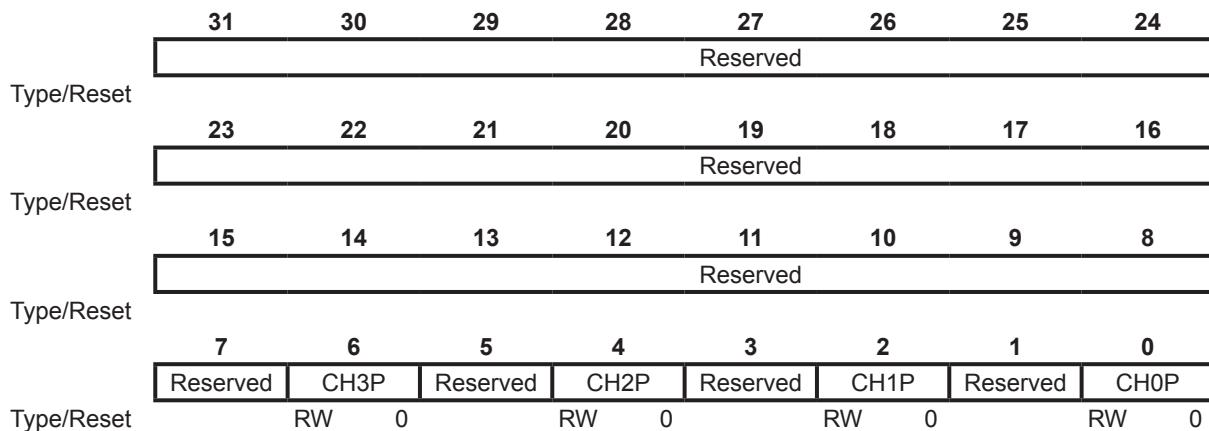

Bits	Field	Descriptions
[6]	CH3E	Channel 3 Capture / Compare Enable - Channel 3 is configured as an input (CH3CCS = 0x1 / 0x2 / 0x3) 0: Input Capture Mode is disabled 1: Input Capture Mode is enabled - Channel 3 is configured as an output (CH3CCS = 0x0) 0: Off – Channel 3 output signal CH3O is not active 1: On – Channel 3 output signal CH3O generated on the corresponding output pin
[4]	CH2E	Channel 2 Capture / Compare Enable - Channel 2 is configured as an input (CH2CCS = 0x1 / 0x2 / 0x3) 0: Input Capture Mode is disabled 1: Input Capture Mode is enabled - Channel 2 is configured as an output (CH2CCS = 0x0) 0: Off – Channel 2 output signal CH2O is not active 1: On – Channel 2 output signal CH2O generated on the corresponding output pin
[2]	CH1E	Channel 1 Capture / Compare Enable - Channel 1 is configured as an input (CH1CCS = 0x1 / 0x2 / 0x3) 0: Input Capture Mode is disabled 1: Input Capture Mode is enabled - Channel 1 is configured as an output (CH1CCS = 0x0) 0: Off – Channel 1 output signal CH1O is not active 1: On – Channel 1 output signal CH1O generated on the corresponding output pin
[0]	CH0E	Channel 0 Capture / Compare Enable - Channel 0 is configured as an input (CH0CCS = 0x1 / 0x2 / 0x3) 0: Input Capture Mode is disabled 1: Input Capture Mode is enabled - Channel 0 is configured as an output (CH0CCS = 0x0) 0: Off – Channel 0 output signal CH0O is not active 1: On – Channel 0 output signal CH0O generated on the corresponding output pin

Channel Polarity Configuration Register – CHPOLR

This register contains the channel capture input or compare output polarity control.

Offset: 0x054

Reset value: 0x0000_0000

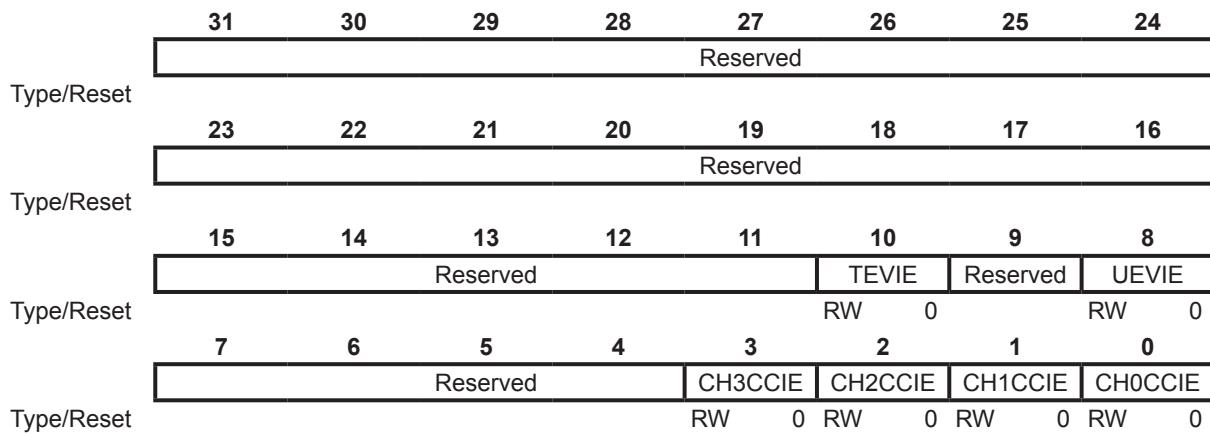

Bits	Field	Descriptions
[6]	CH3P	Channel 3 Capture / Compare Polarity - When Channel 3 is configured as an input (CH3CCS = 0x1 / 0x2 / 0x3) 0: Capture event occurs on a Channel 3 rising edge 1: Capture event occurs on a Channel 3 falling edge - When Channel 3 is configured as an output (CH3CCS = 0x0) 0: Channel 3 Output is active high 1: Channel 3 Output is active low
[4]	CH2P	Channel 2 Capture / Compare Polarity - When Channel 2 is configured as an input (CH2CCS = 0x1 / 0x2 / 0x3) 0: Capture event occurs on a Channel 2 rising edge 1: Capture event occurs on a Channel 2 falling edge - When Channel 2 is configured as an output (CH2CCS = 0x0) 0: Channel 2 Output is active high 1: Channel 2 Output is active low
[2]	CH1P	Channel 1 Capture / Compare Polarity - When Channel 1 is configured as an input (CH1CCS = 0x1 / 0x2 / 0x3) 0: Capture event occurs on a Channel 1 rising edge 1: Capture event occurs on a Channel 1 falling edge - When Channel 1 is configured as an output (CH1CCS = 0x0) 0: Channel 1 Output is active high 1: Channel 1 Output is active low
[0]	CH0P	Channel 0 Capture / Compare Polarity - When Channel 0 is configured as an input (CH0CCS = 0x1 / 0x2 / 0x3) 0: Capture event occurs on a Channel 0 rising edge 1: Capture event occurs on a Channel 0 falling edge - When Channel 0 is configured as an output (CH0CCS = 0x0) 0: Channel 0 Output is active high 1: Channel 0 Output is active low

Timer Interrupt Control Register – DICTR

This register contains the timer interrupt enable control bits.

Offset: 0x074

Reset value: 0x0000_0000

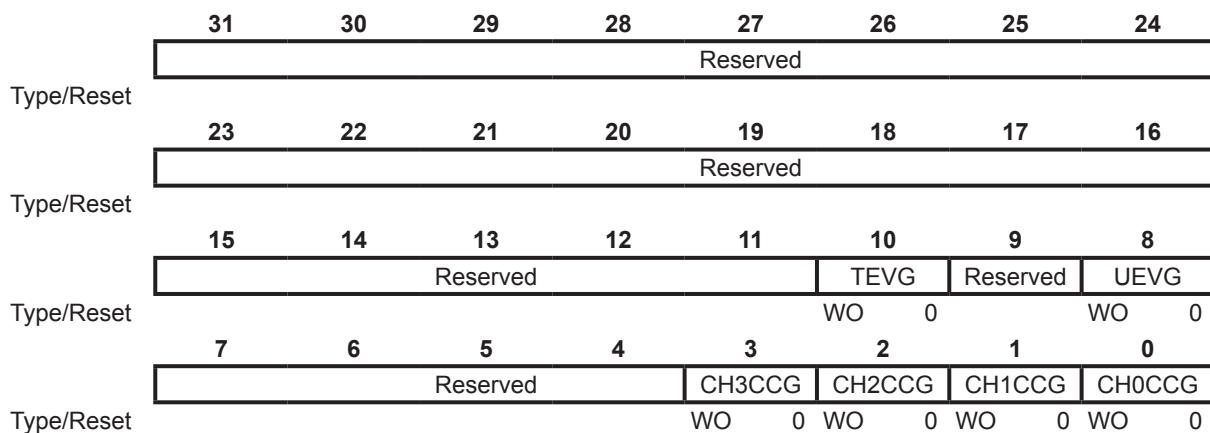

Bits	Field	Descriptions
[10]	TEVIE	Trigger event Interrupt Enable 0: Trigger event interrupt is disabled 1: Trigger event interrupt is enabled
[8]	UEVIE	Update event Interrupt Enable 0: Update event interrupt is disabled 1: Update event interrupt is enabled
[3]	CH3CCIE	Channel 3 Capture / Compare Interrupt Enable 0: Channel 3 interrupt is disabled 1: Channel 3 interrupt is enabled
[2]	CH2CCIE	Channel 2 Capture / Compare Interrupt Enable 0: Channel 2 interrupt is disabled 1: Channel 2 interrupt is enabled
[1]	CH1CCIE	Channel 1 Capture / Compare Interrupt Enable 0: Channel 1 interrupt is disabled 1: Channel 1 interrupt is enabled
[0]	CH0CCIE	Channel 0 Capture / Compare Interrupt Enable 0: Channel 0 interrupt is disabled 1: Channel 0 interrupt is enabled

Timer Event Generator Register – EVGR

This register contains the software event generation bits.

Offset: 0x078

Reset value: 0x0000_0000

Bits	Field	Descriptions
[10]	TEVG	<p>Trigger Event Generation</p> <p>The trigger event TEV can be generated by setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: TEVIF flag is set</p>
[8]	UEVG	<p>Update Event Generation</p> <p>The update event UEV can be generated by setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: Reinitialize the counter</p> <p>The counter value returns to 0 or the CRR preload value, depending on the counter mode in which the current timer is being used. An update operation of any related registers will also be performed. For more detail descriptions, refer to the corresponding section.</p>
[3]	CH3CCG	<p>Channel 3 Capture / Compare Generation</p> <p>A Channel 3 capture / compare event can be generated by setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: Capture / compare event is generated on channel 3</p> <p>If Channel 3 is configured as an input, the counter value is captured into the CH3CCR register and then the CH3CCIF bit is set. If Channel 3 is configured as an output, the CH3CCIF bit is set.</p>
[2]	CH2CCG	<p>Channel 2 Capture / Compare Generation</p> <p>A Channel 2 capture / compare event can be generated by setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: Capture / compare event is generated on channel 2</p> <p>If Channel 2 is configured as an input, the counter value is captured into the CH2CCR register and then the CH2CCIF bit is set. If Channel 2 is configured as an output, the CH2CCIF bit is set.</p>

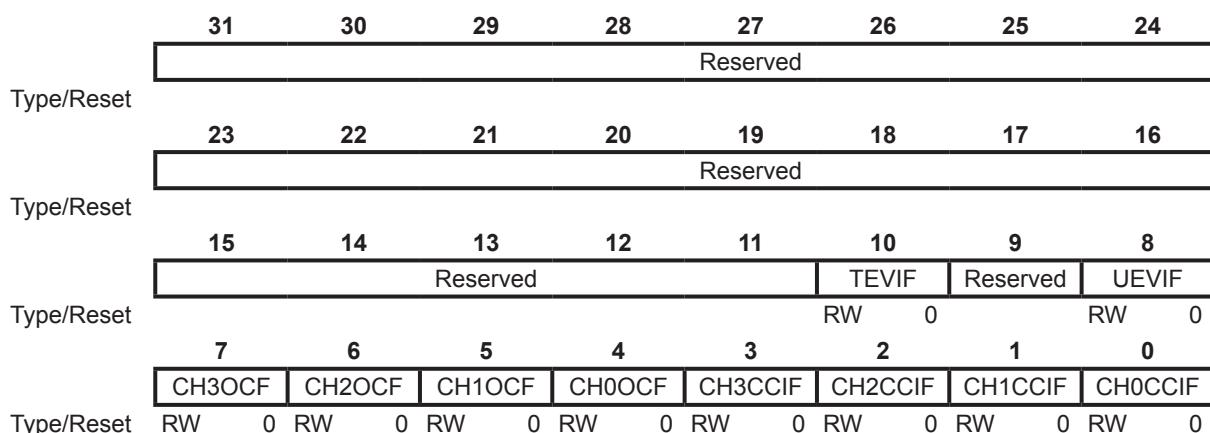

Bits	Field	Descriptions
[1]	CH1CCG	<p>Channel 1 Capture / Compare Generation</p> <p>A Channel 1 capture / compare event can be generated by setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: Capture / compare event is generated on channel 1</p> <p>If Channel 1 is configured as an input, the counter value is captured into the CH1CCR register and then the CH1CCIF bit is set. If Channel 1 is configured as an output, the CH1CCIF bit is set.</p>
[0]	CH0CCG	<p>Channel 0 Capture / Compare Generation</p> <p>A Channel 0 capture / compare event can be generated by setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: Capture / compare event is generated on channel 0</p> <p>If Channel 0 is configured as an input, the counter value is captured into the CH0CCR register and then the CH0CCIF bit is set. If Channel 0 is configured as an output, the CH0CCIF bit is set.</p>

Timer Interrupt Status Register – INTSR

This register stores the timer interrupt status.

Offset: 0x07C

Reset value: 0x0000_0000

Bits	Field	Descriptions
[10]	TEVIF	<p>Trigger Event Interrupt Flag</p> <p>This flag is set by hardware on a trigger event and is cleared by software.</p> <p>0: No trigger event occurs 1: Trigger event occurs</p>

Bits	Field	Descriptions
[8]	UEVIF	<p>Update Event Interrupt Flag</p> <p>This bit is set by hardware on an update event and is cleared by software.</p> <ul style="list-style-type: none"> 0: No update event occurs 1: Update event occurs <p>Note: The update event is derived from the following conditions:</p> <ul style="list-style-type: none"> - The counter overflows or underflows - The UEVG bit is asserted - A restart trigger event occurs from the slave trigger input
[7]	CH3OCF	<p>Channel 3 Over-Capture Flag</p> <p>This flag is set by hardware and cleared by software.</p> <ul style="list-style-type: none"> 0: No over-capture event is detected 1: Capture event occurs again when the CH3CCIF bit is already set and it is not yet cleared by software
[6]	CH2OCF	<p>Channel 2 Over-Capture Flag</p> <p>This flag is set by hardware and cleared by software.</p> <ul style="list-style-type: none"> 0: No over-capture event is detected 1: Capture event occurs again when the CH2CCIF bit is already set and it is not cleared yet by software
[5]	CH1OCF	<p>Channel 1 Over-Capture Flag</p> <p>This flag is set by hardware and cleared by software.</p> <ul style="list-style-type: none"> 0: No over-capture event is detected 1: Capture event occurs again when the CH1CCIF bit is already set and it is not cleared yet by software.
[4]	CH0OCF	<p>Channel 0 Over-Capture Flag</p> <p>This flag is set by hardware and cleared by software.</p> <ul style="list-style-type: none"> 0: No over-capture event is detected 1: Capture event occurs again when the CH0CCIF bit is already set and it is not yet cleared by software.
[3]	CH3CCIF	<p>Channel 3 Capture / Compare Interrupt Flag</p> <ul style="list-style-type: none"> - Channel 3 is configured as an output: <ul style="list-style-type: none"> 0: No match event occurs 1: The contents of the counter CNTR have matched the contents of the CH3CCR register <p>This flag is set by hardware when the counter value matches the CH3CCR value except in the center-aligned mode. It is cleared by software.</p> - Channel 3 is configured as an input: <ul style="list-style-type: none"> 0: No input capture occurs 1: Input capture occurs <p>This bit is set by hardware on a capture event. It is cleared by software or by reading the CH3CCR register.</p>
[2]	CH2CCIF	<p>Channel 2 Capture / Compare Interrupt Flag</p> <ul style="list-style-type: none"> - Channel 2 is configured as an output: <ul style="list-style-type: none"> 0: No match event occurs 1: The contents of the counter CNTR have matched the contents of the CH2CCR register <p>This flag is set by hardware when the counter value matches the CH2CCR value except in the center-aligned mode. It is cleared by software or by reading the CH0CCR register.</p>

Timer Counter Register – CNTR

This register stores the timer counter value.

Offset: 0x080

Reset value: 0x0000_0000

Bits	Field	Descriptions
[15:0]	CNTV	Counter Value

Timer Prescaler Register – PSCR

This register specifies the timer prescaler value to generate the counter clock.

Offset: 0x084

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24	
Type/Reset	Reserved								
	23	22	21	20	19	18	17	16	
Type/Reset	Reserved

	7	6	5	4	3	2	1	0	
Type/Reset	RW	0	RW	0	RW	0	RW	0	
	PSCV								

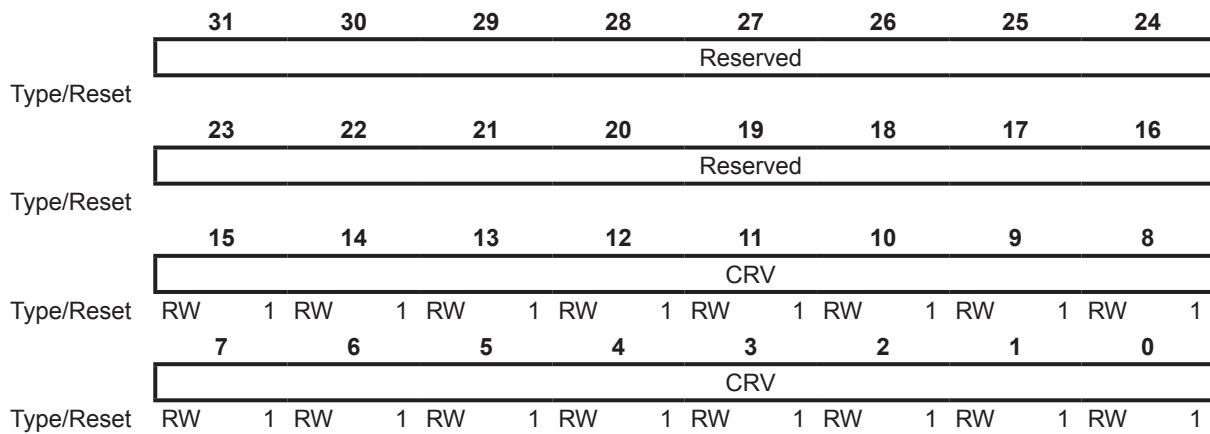

Bits	Field	Descriptions
[15:0]	PSCV	<p>Prescaler Value</p> <p>These bits are used to specify the prescaler value to generate the counter clock frequency f_{CK_CNT}.</p> $f_{CK_CNT} = \frac{f_{CK_PSC}}{PSCV[15:0] + 1}$, where the f_{CK_PSC} is the prescaler clock source.

Timer Counter Reload Register – CRR

This register specifies the timer counter reload value.

Offset: 0x088

Reset value: 0x0000_FFFF

Bits	Field	Descriptions
[15:0]	CRV	Counter Reload Value The CRV is the reload value which is loaded into the actual counter register.

Channel 0 Capture / Compare Register – CH0CCR

This register specifies the timer channel 0 capture / compare value.

Offset: 0x090

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24	
Type/Reset	Reserved

Pulse Width Modulator (PWM)

Introduction

The Pulse Width Modulator consists of one 16-bit up / down-counter, four 16-bit Compare Registers (CRs), one 16-bit Counter Reload Register (CRR) and several control / status registers. It can be used for a variety of purposes including general timer and output waveform generation such as single pulse generation or PWM output.

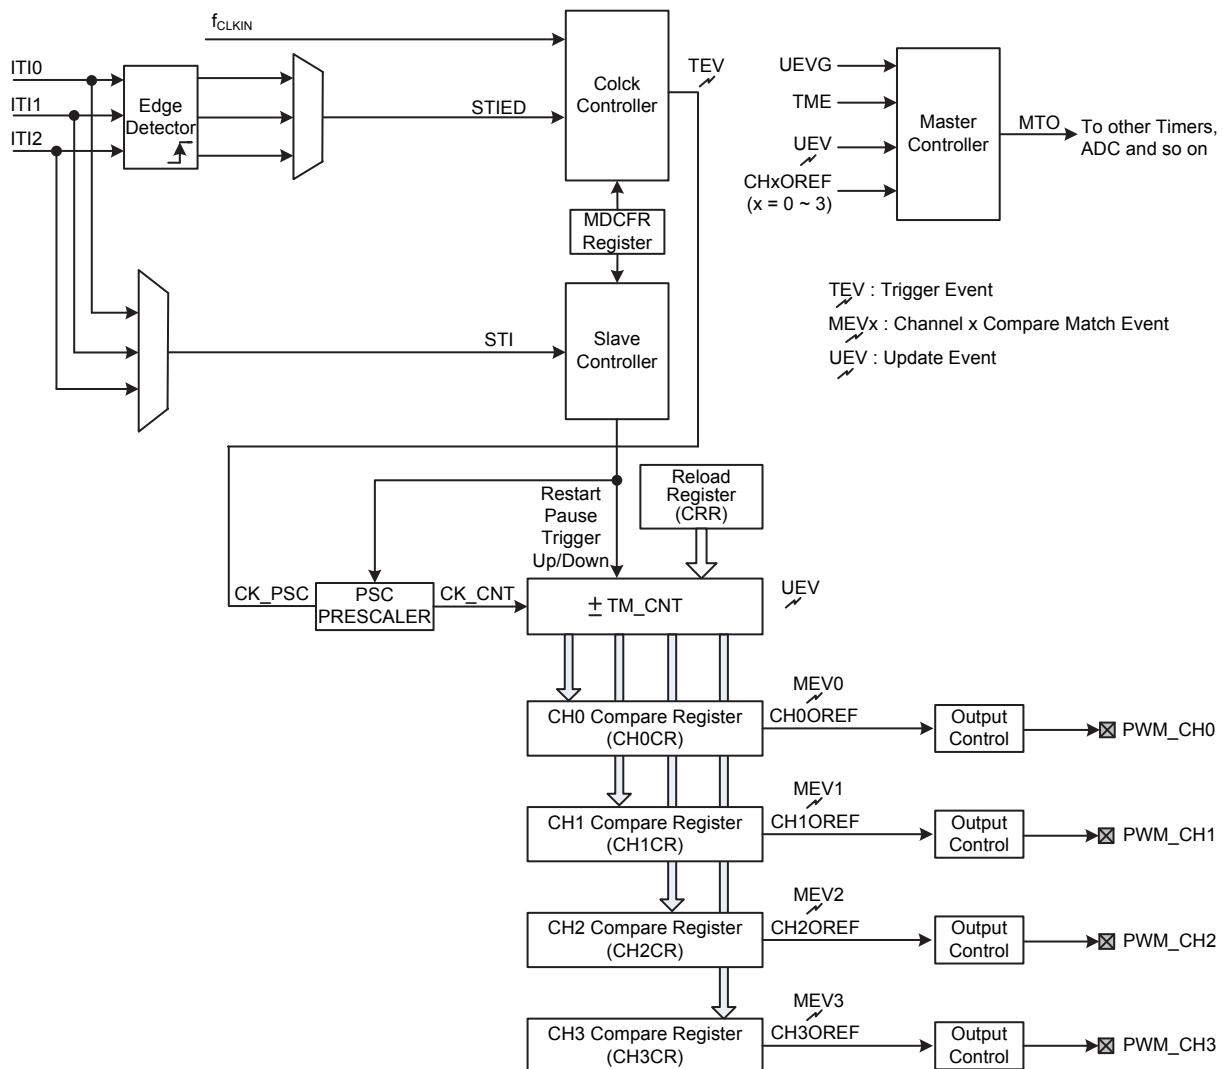

Figure 63. PWM Block Diagram

Features

- 16-bit up / down auto-reload counter
- 16-bit programmable prescaler that allows division of the counter clock frequency by any factor between 1 and 65536
- Up to 4 independent channels for:
 - Compare Match Output
 - Generation of PWM waveform – Edge and Center-aligned Mode
 - Single Pulse Mode Output
- Synchronization circuit to control the timer with external signals and to interconnect several timers together
- Interrupt generation with the following events:
 - Update event
 - Trigger event
 - Output compare match event
- PWM Master / Slave mode controller

Functional Descriptions

Counter Mode

Up-Counting

In this mode the counter counts continuously from 0 to the counter reload value, which is defined in the CRR register, in a count-up direction. Once the counter reaches the counter reload value, the Timer Module generates an overflow event and the counter restarts to count once again from 0. This action will continue repeatedly. The counting direction bit DIR in the CNTCFR register should be set to 0 for the up-counting mode.

When the update event is generated by setting the UEVG bit in the EVGR register to 1, the counter value will also be initialized to 0.

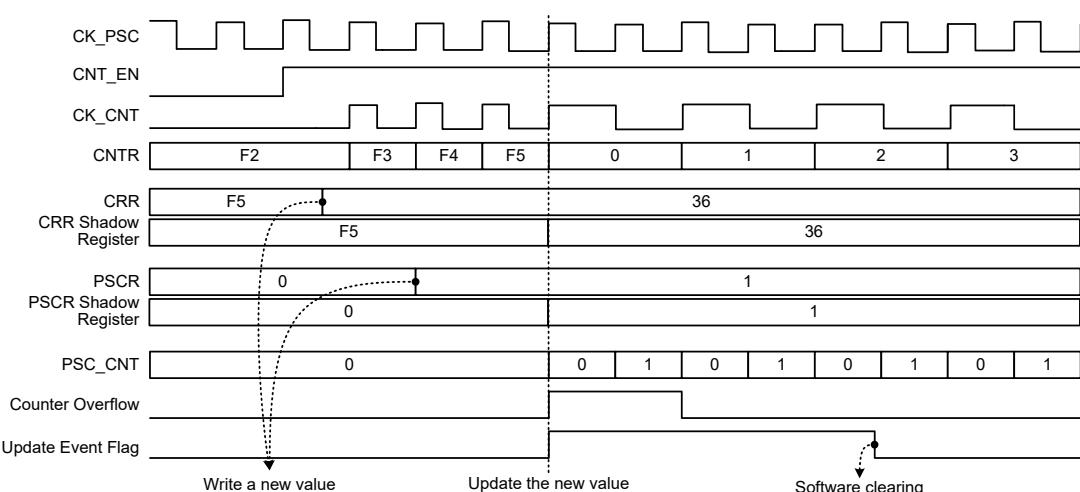

Figure 64. Up-counting Example

Down-Counting

In this mode the counter counts continuously from the counter reload value, which is defined in the CRR register, to 0 in a count-down direction. Once the counter reaches 0, the Timer module generates an underflow event and the counter restarts to count once again from the counter reload value. This action will continue repeatedly. The counting direction bit DIR in the CNTCFR register should be set to 1 for the down-counting mode.

When the update event is set by the UEVG bit in the EVGR register, the counter value will also be initialized to the counter reload value.

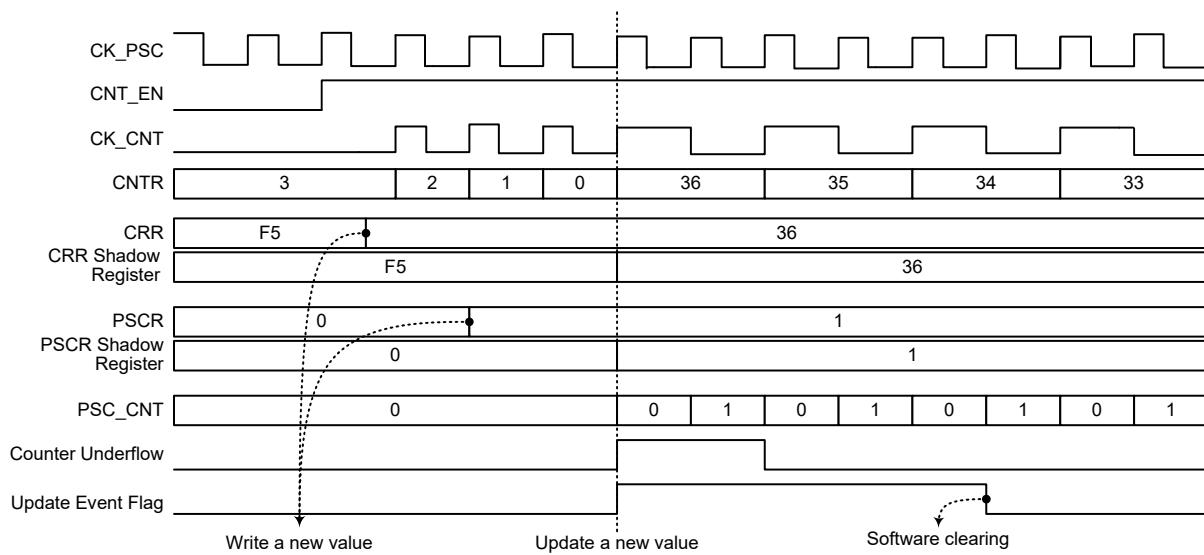

Figure 65. Down-counting Example

Center-Aligned Counting

In the center-aligned counting mode, the counter counts up from 0 to the counter reload value and then counts down to 0 alternatively. The Timer module generates an overflow event when the counter counts to the counter reload value in the up-counting mode and generates an underflow event when the counter counts to 0 in the down-counting mode. The counting direction bit DIR in the CNTCFR register is read-only and indicates the counting direction when in the center-align mode. The counting direction is updated by hardware automatically.

Setting the UEVG bit in the EVGR register will initialize the counter value to 0 irrespective of whether the counter is counting up or down in the center-aligned counting mode.

The UEVIF bit in the INTSR register can be set to 1 when an overflow or underflow event or both of them occur according to the CMSEL field setting in the CNTCFR register.

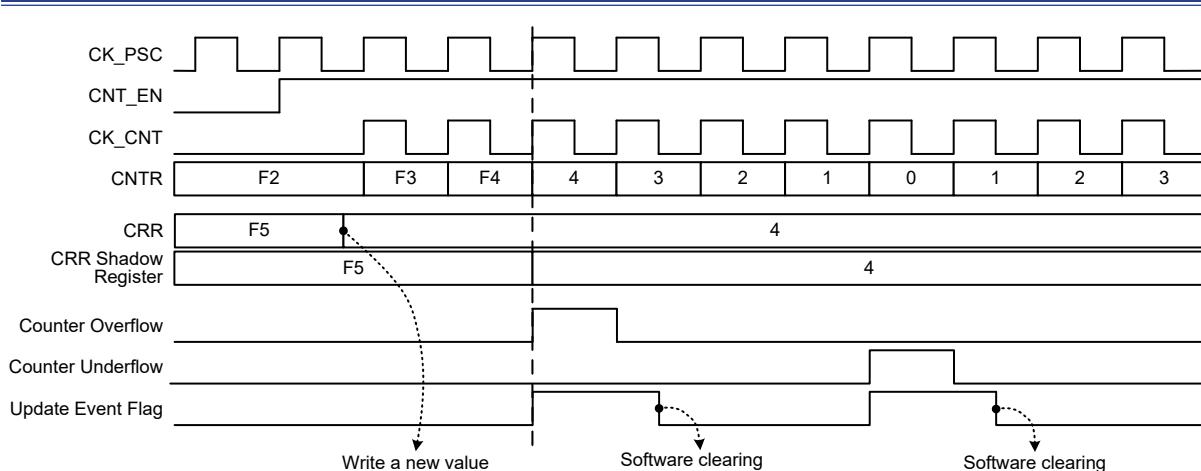

Figure 66. Center-aligned Counting Example

Clock Controller

The following describes the Timer Module clock controller which determines the clock source of the internal prescaler counter.

■ Internal APB clock f_{CLKIN} :

The default internal clock source is the APB clock f_{CLKIN} used to drive the counter prescaler.

■ STIED:

The counter prescaler can count during each rising edge of the STI signal. This mode can be selected by setting the SMSEL field to 0x7 in the MDCFR register. Here the counter will act as an event counter. The input event, known as STI here, can be selected by setting the TRSEL field to an available value except the value of 0x0. When the STI signal is selected as the clock source, the internal edge detection circuitry will generate a clock pulse during each STI signal rising edge to drive the counter prescaler. It is important to note that if the TRSEL field is set to 0x0 to select the software UEVG bit as the trigger source, then when the SMSEL field is set to 0x7, the counter will be updated instead of counting.

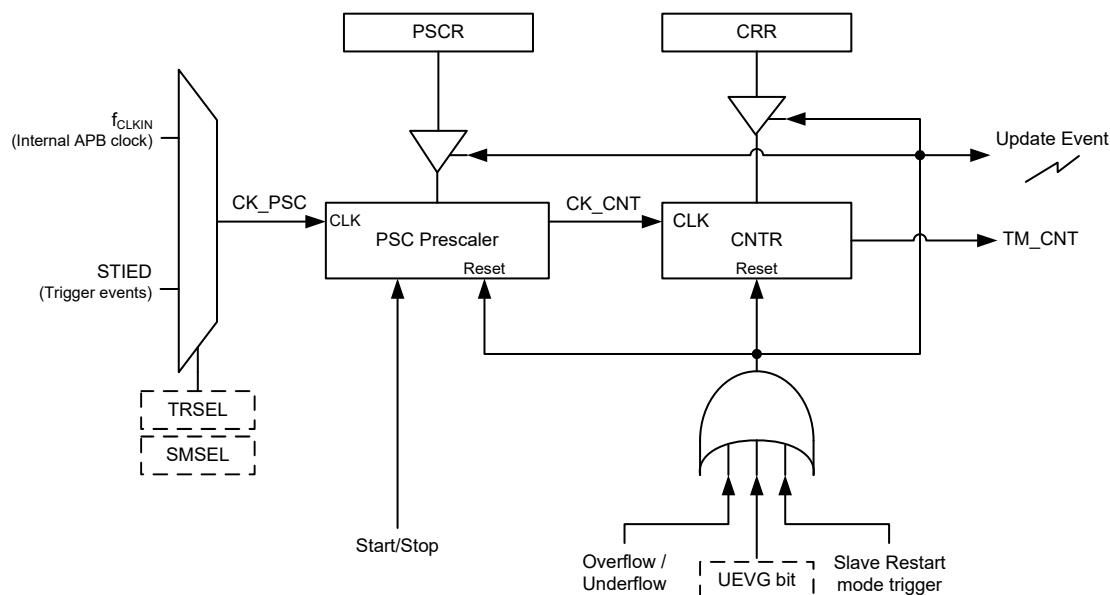

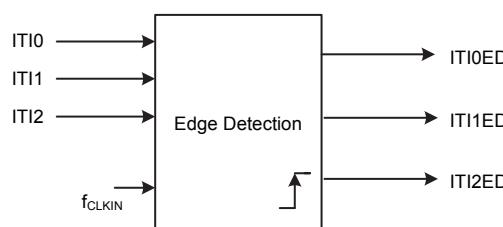

Figure 67. PWM Clock Selection Source

Trigger Controller

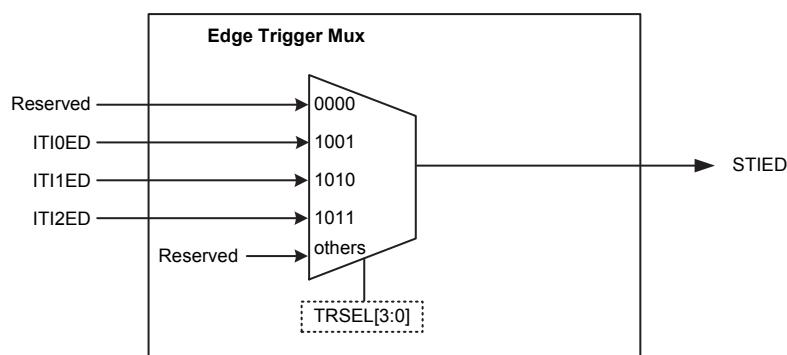

The trigger controller is used to select the trigger source and setup the trigger level or edge trigger condition. For the internal trigger input, it can be selected by the Trigger Selection bits TRSEL in the TRCFR register. For all the trigger sources except the UEVG bit software trigger, the internal edge detection circuitry will generate a clock pulse at each trigger signal rising edge to stimulate some PWM functions which are triggered by a trigger signal rising edge.

Trigger Controller Block = Edge Trigger Mux + Level Trigger Mux

Internal Trigger Input

Edge Trigger = Internal (ITIx)

Level Trigger Source = Internal (ITIx) + Software UEVG bit

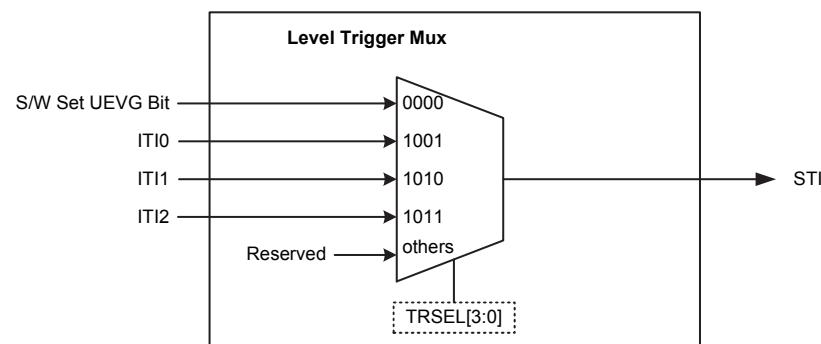

Figure 68. Trigger Control Block

Slave Controller

The PWM can be synchronized with an external trigger in several modes including the Restart mode, the Pause mode and the Trigger mode which is selected by the SMSEL field in the MDCFR register. The trigger input of these modes comes from the STI signal which is selected by the TRSEL field in the TRCFR register. The operation modes in the Slave Controller are described in the accompanying sections.

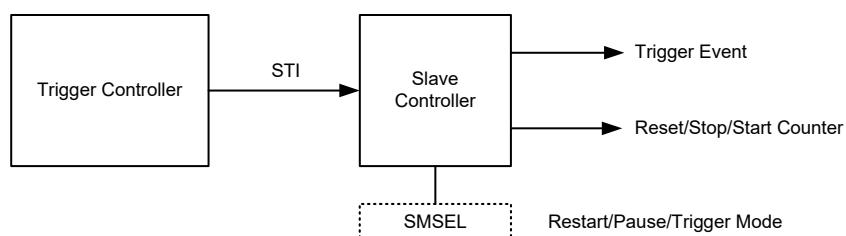

Figure 69. Slave Controller Diagram

Restart Mode

The counter and its prescaler can be reinitialized in response to a rising edge of the STI signal. When an STI rising edge occurs, the update event software generation bit named UEVG will automatically be asserted by hardware and the trigger event flag will also be set. Then the counter and prescaler will be reinitialized. Although the UEVG bit is set to 1 by hardware, the update event does not really occur. It depends upon whether the update event disable control bit UEVDIS is set to 1 or not. If the UEVDIS is set to 1 to disable the update event to occur, there will no update event be generated, however the counter and prescaler are still reinitialized when the STI rising edge occurs. If the UEVDIS bit in the CNTCFR register is cleared to enable the update event to occur, an update event will be generated together with the STI rising edge, then all the preloaded registers will be updated.

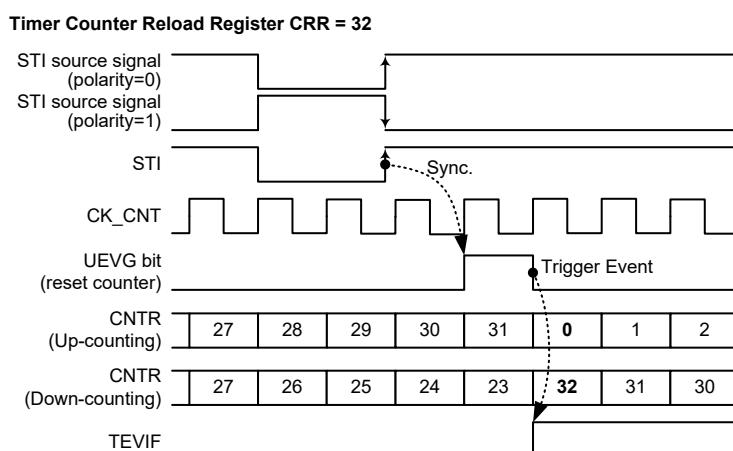

Figure 70. PWM in Restart Mode

Pause Mode

In the Pause Mode, the selected STI input signal level is used to control the counter start / stop operation. The counter starts to count when the selected STI signal is at a high level and stops counting when the STI signal is changed to a low level, here the counter will maintain its present value and will not be reset. Since the Pause function depends upon the STI level to control the counter stop / start operation.

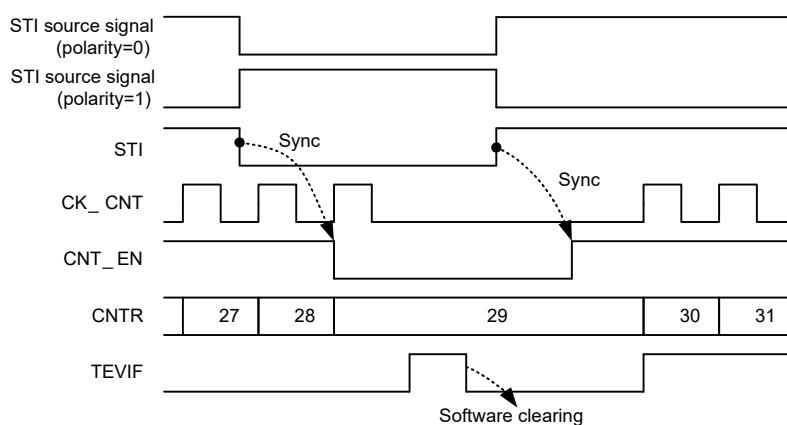

Figure 71. PWM in Pause Mode

Trigger Mode

After the counter is disabled to count, the counter can resume counting when an STI rising edge signal occurs. When an STI rising edge occurs, the counter will start to count from the current value in the counter. Note that if the STI signal is selected to be derived from the UEVG bit software trigger, the counter will not resume counting. When software triggering using the UEVG bit is selected as the STI source signal, there will be no clock pulse generated which can be used to make the counter resume counting. Note that the STI signal is only used to enable the counter to resume counting and has no effect on controlling the counter to stop counting.

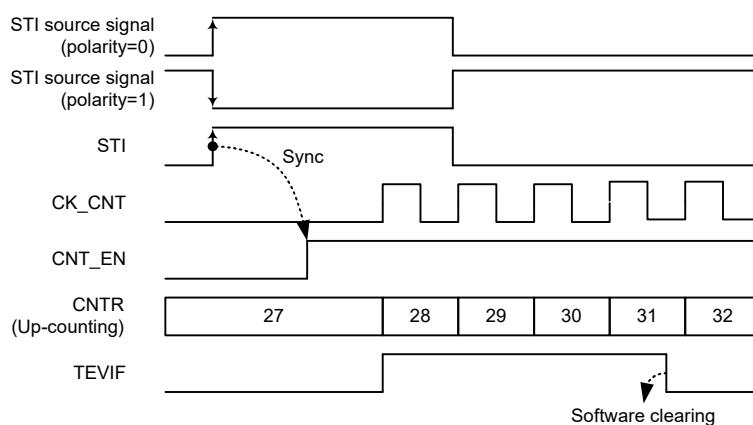

Figure 72. PWM in Trigger Mode

Master Controller

The PWMs and TMs can be linked together internally for timer synchronization or chaining. When one PWM is configured to be in the Master Mode, the PWM Master Controller will generate a Master Trigger Output (MTO) signal which includes a reset, a start, a stop signal or a clock source which is selected by the MMSEL field in the MDCFR register to trigger or drive another PWM or TM, if exists, which is configured in the Slave Mode.

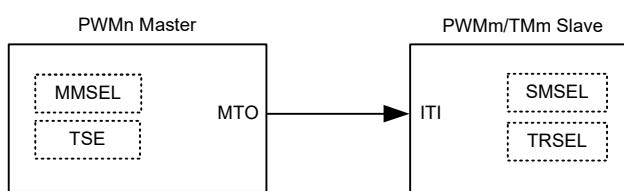

Figure 73. Master PWMn and Slave PWMm / TMm Connection

The Master Mode Selection bits, MMSEL, in the MDCFR register are used to select the MTO source for synchronizing another slave PWM or TM if exists.

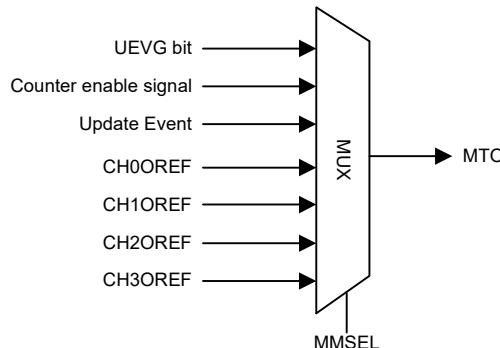

Figure 74. MTO Selection

For example, setting the MMSEL field to 0x5 is to select the CH1OREF signal as the MTO signal to synchronize another slave PWM or TM. For a more detailed description, refer to the related MMSEL field definitions in the MDCFR register.

Channel Controller

The PWM has four independent channels which can be used as compare match outputs. Each compare match output channel is composed of a preload register and a shadow register. Data access of the APB bus is always implemented by reading / writing preload register.

When used in the compare match output mode, the contents of the CHxCR preload register is copied into the associated shadow register; the counter value is then compared with the register value.

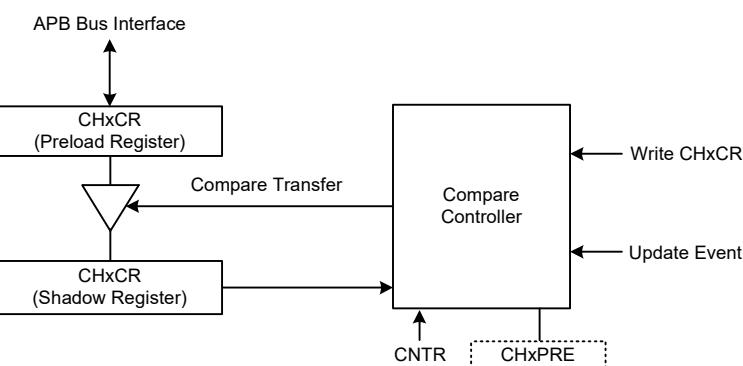

Figure 75. Compare Block Diagram

Output Stage

The PWM has four channels for compare match, single pulse or PWM output function. The channel output PWM_CHx is controlled by the CHxOM, CHxP and CHxE bits in the corresponding CHxOCFR, CHPOLR and CHCTR registers.

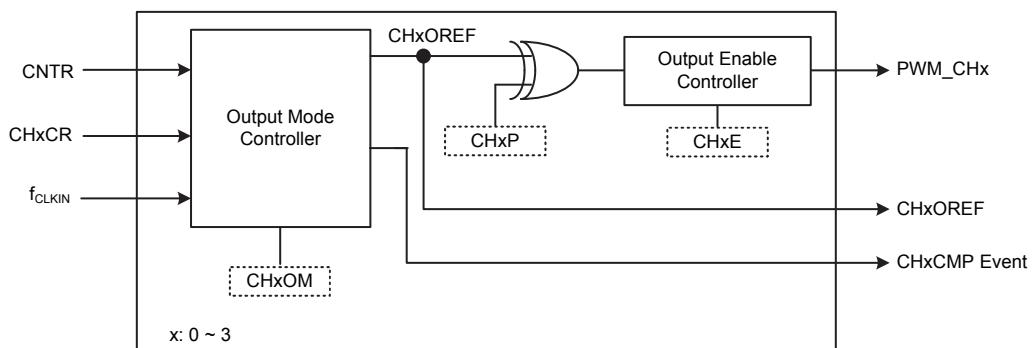

Figure 76. Output Stage Block Diagram

Channel Output Reference Signal

When the PWM is used in the compare match output mode, the CHxOREF signal (Channel x Output Reference signal) is defined by the CHxOM bit setup. The CHxOREF signal has several types of output function which defines what happens to the output when the counter value matches the contents of the CHxCR register. In addition to the low, high and toggle CHxOREF output types; there are also PWM mode 1 and PWM mode 2 outputs. In these modes, the CHxOREF signal level is changed according to the count direction and the relationship between the counter value and the CHxCR content. There are also two modes which will force the output into an inactive or active state irrespective of the CHxCR content or counter values. With regard to a more detailed description refer to the relative bit definition. The accompanying Table 30 shows a summary of the output type setup.

Table 30. Compare Match Output Setup

CHxOM Value	Compare Match Level
0x0	No change
0x1	Clear Output to 0
0x2	Set Output to 1
0x3	Toggle Output
0x4	Force Inactive Level
0x5	Force Active Level
0x6	PWM Mode 1
0x7	PWM Mode 2

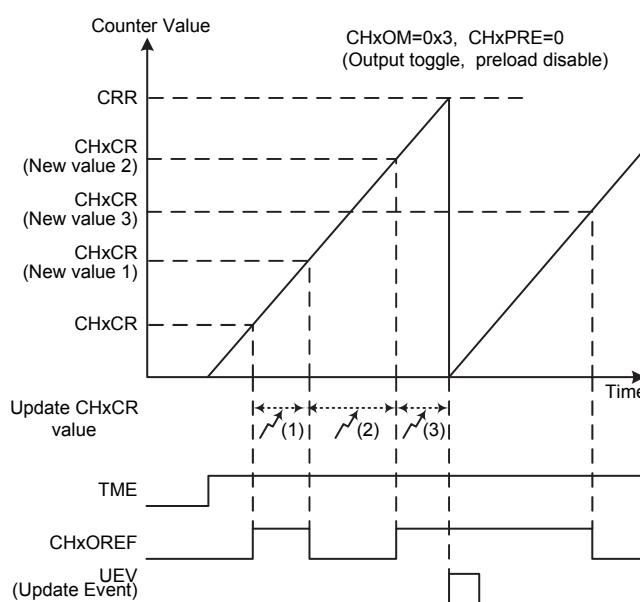

Figure 77. Toggle Mode Channel Output Reference Signal (CHxPRE = 0)

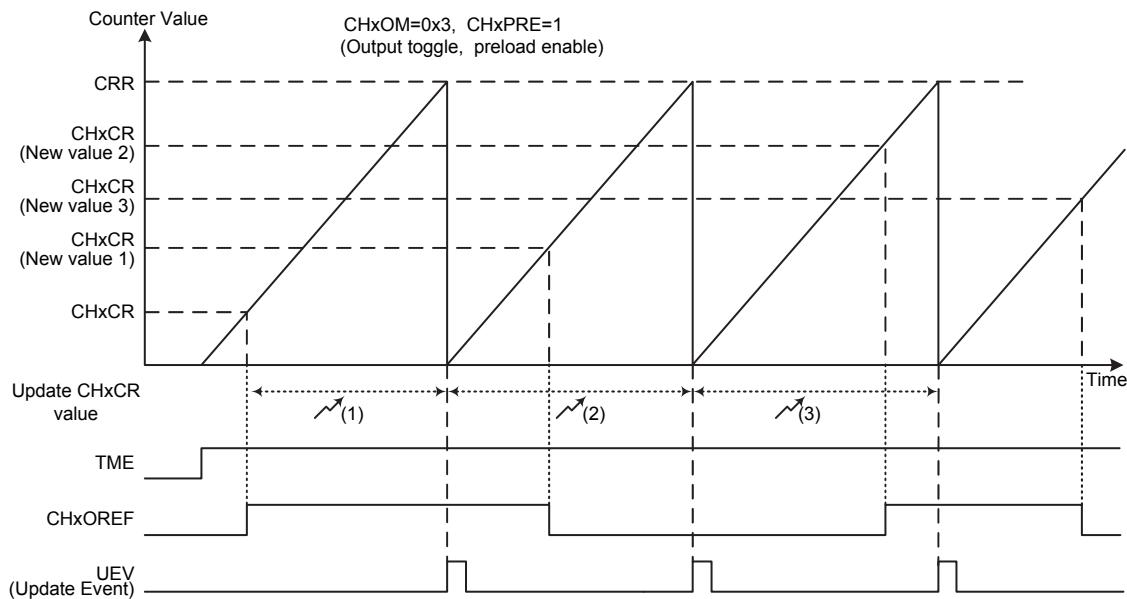

Figure 78. Toggle Mode Channel Output Reference Signal (CHxPRE = 1)

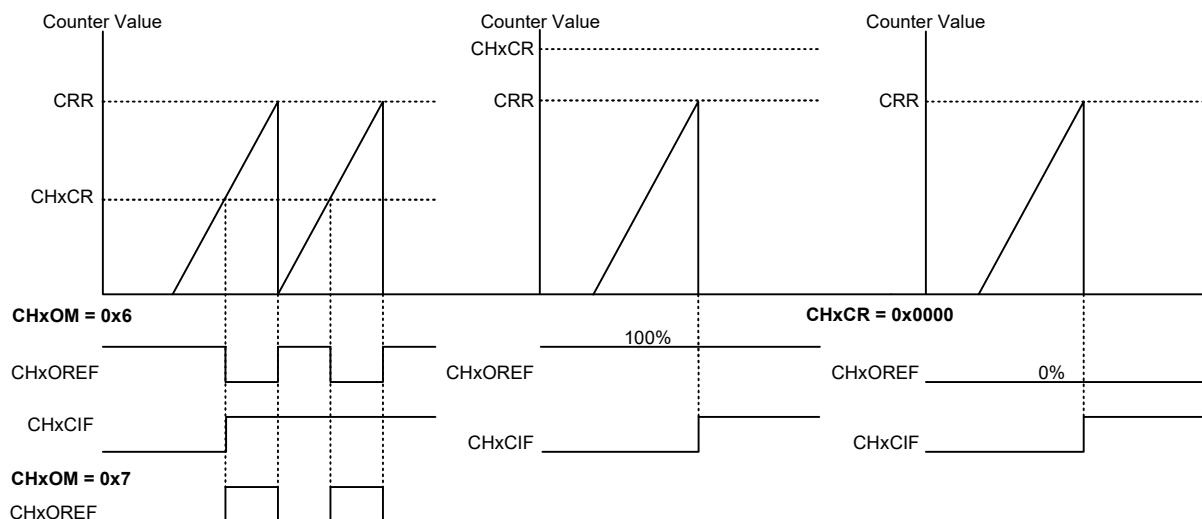

Figure 79. PWM Mode Channel Output Reference Signal and Counter in Up-counting Mode

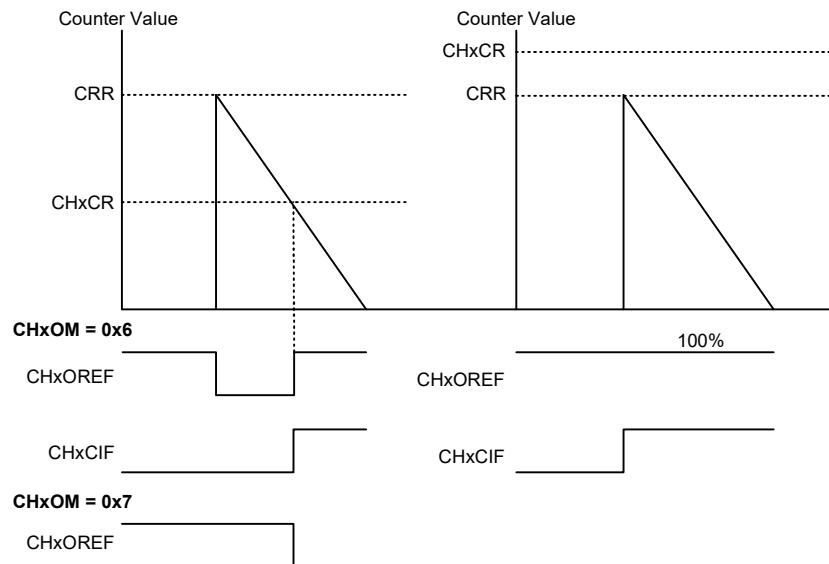

Figure 80. PWM Mode Channel Output Reference Signal and Counter in Down-counting Mode

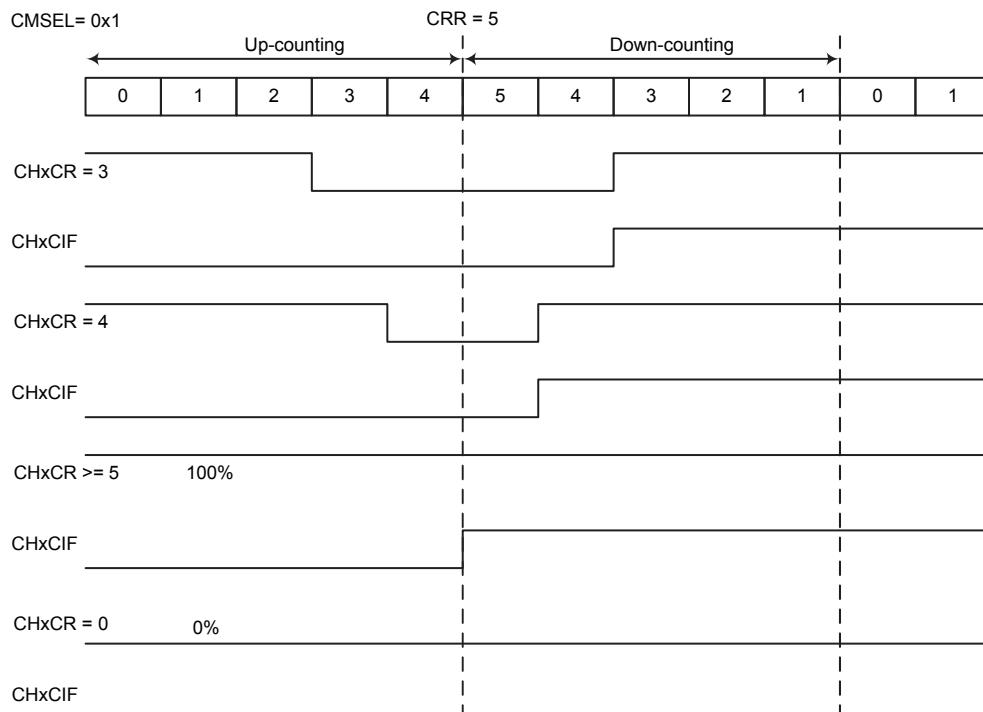

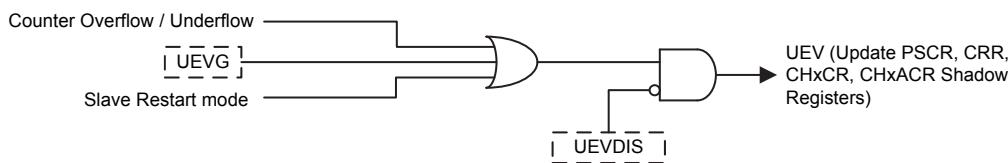

Figure 81. PWM Mode Channel Output Reference Signal and Counter in Centre-aligned Mode

Update Management

The Update event is used to update the CRR, the PSCR, the CHxACR and the CHxCR values from the actual registers to the corresponding shadow registers. An update event occurs when the counter overflows or underflows, the software update control bit is triggered or an update event from the slave controller is generated.

The UEVDIS bit in the CNTCFR register can determine whether the update event occurs or not. When the update event occurs, the corresponding update event interrupt will be generated depending upon whether the update event interrupt generation function is enabled or not by configuring the UGDIS bit in the CNTCFR register. For more detailed description, refer to the UEVDIS and UGDIS bit definition in the CNTCFR register.

Update Event Management

Update Event Interrupt Management

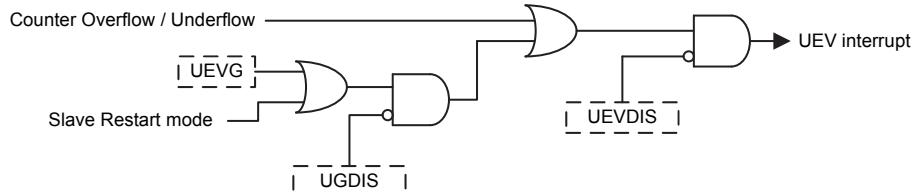

Figure 82. Update Event Setting Diagram

Single Pulse Mode

Once the timer is set to operate in the single pulse mode, it is not necessary to set the timer enable bit TME in the CTR register to 1 to enable the counter. The trigger to generate a pulse can be sourced from the STI signal rising edge or by setting the TME bit to 1 using software. Setting the TME bit to 1 or a trigger from the STI signal rising edge can generate a pulse and then keep the TME bit at a high state until the update event occurs or the TME bit is written to 0 by software. If the TME bit is cleared to 0 using software, the counter will be stopped and its value held. If the TME bit is automatically cleared to 0 by a hardware update event, the counter will be reinitialized.

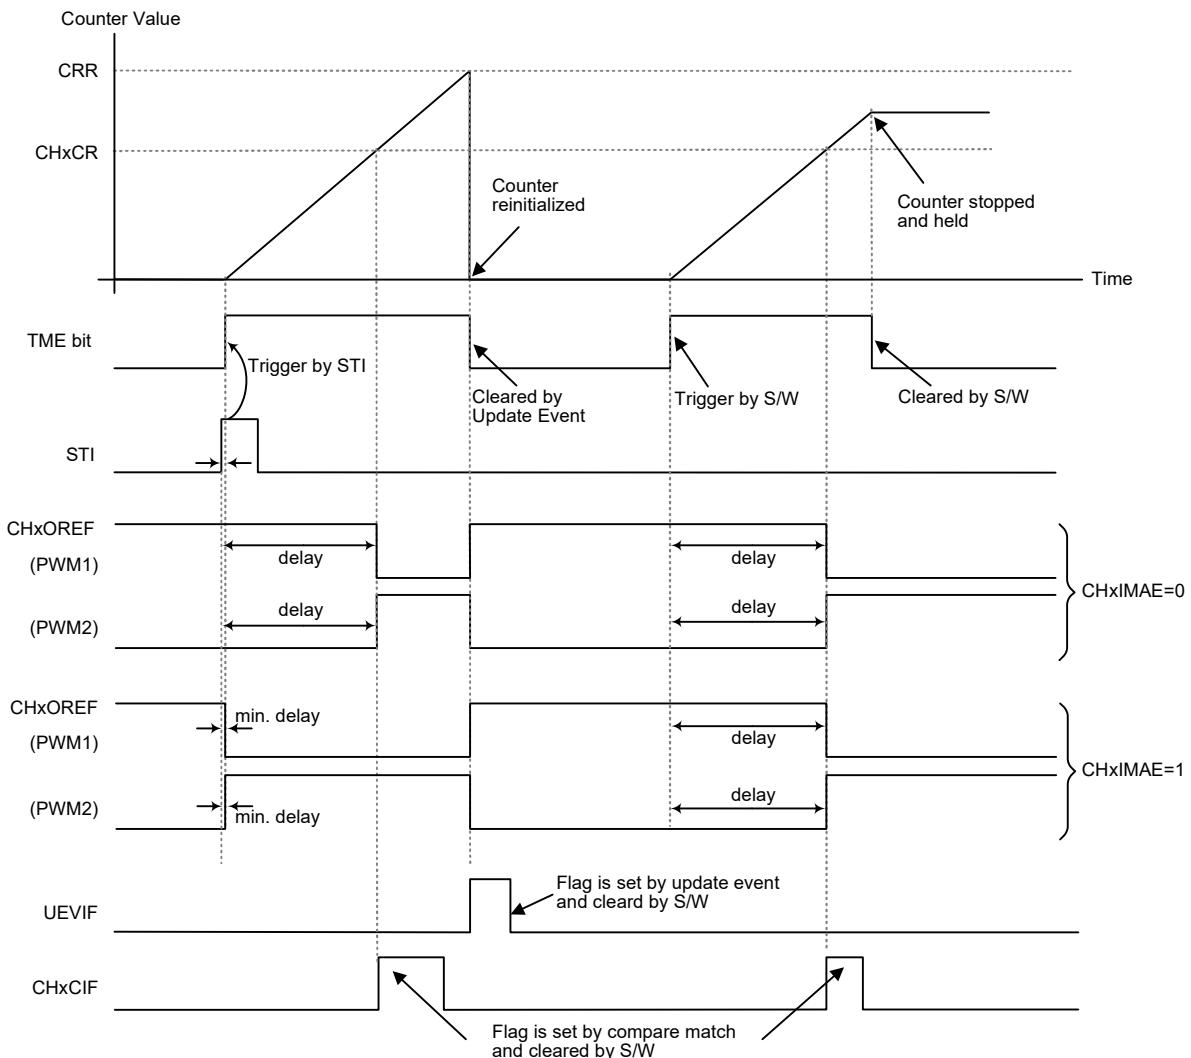

Figure 83. Single Pulse Mode

In the Single Pulse mode, the STI active edge which sets the TME bit to 1 will enable the counter. However, there exist several clock delays to perform the comparison result between the counter value and the CHxCR value. In order to reduce the delay to a minimum value, the user can set the CHxIMAE bit in each CHxOCCR register. After an STI rising edge trigger occurs in the single pulse mode, the CHxOREF signal will immediately be forced to the state which the CHxOREF signal will change to as the compare match event occurs without taking the comparison result into account. The CHxIMAE bit is available only when the output channel is configured to operate in the PWM Mode 1 or PWM Mode 2 and the trigger source is derived from the STI signal.

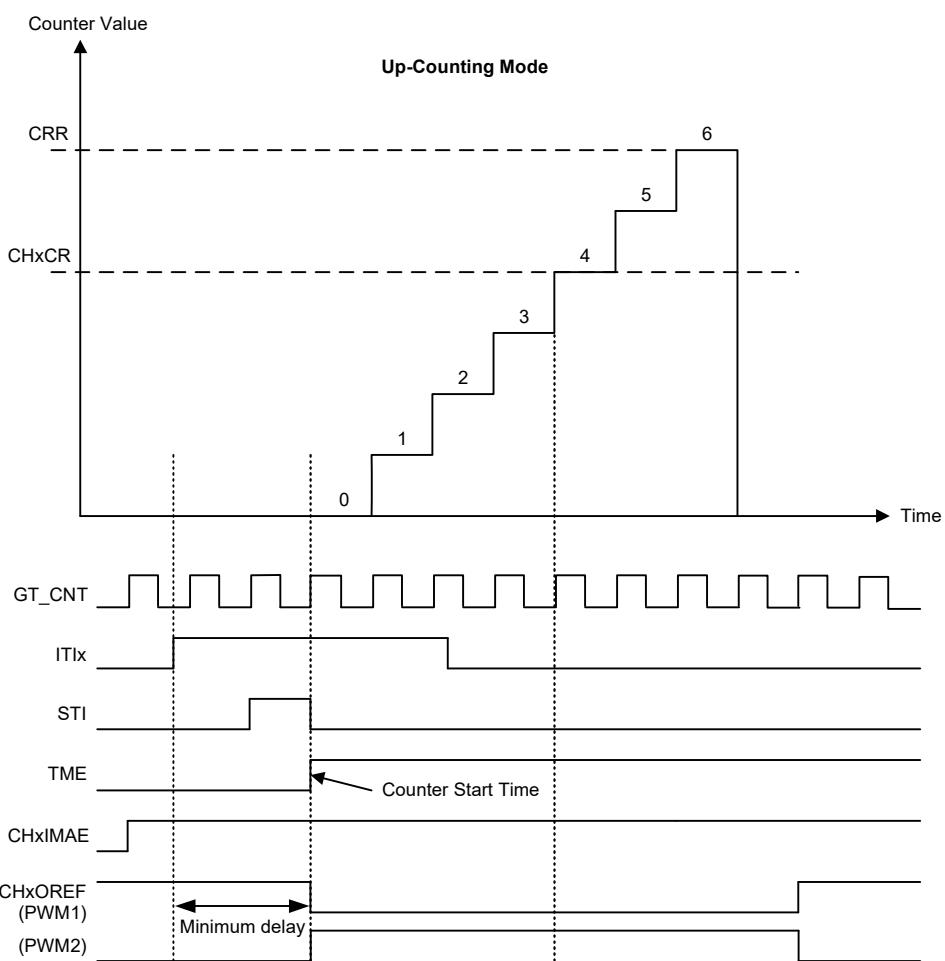

Figure 84. Immediate Active Mode Minimum Delay

Asymmetric PWM Mode

Asymmetric PWM mode allows two center-aligned PWM signals to be generated with a programmable phase shift. While the PWM frequency is determined by the value of the CRR register, the duty cycle and the phase-shift are determined by the CHxCR and CHxACR register. When the counter is counting up, the PWM uses the value in CHxCR as up-count compare value. When the counter is into counting down stage, the PWM uses the value in CHxACR as down-count compare value. The Figure 85 is shown an example for asymmetric PWM mode in center-aligned counting mode.

Note: Asymmetric PWM mode can only be operated in center-aligned counting mode.

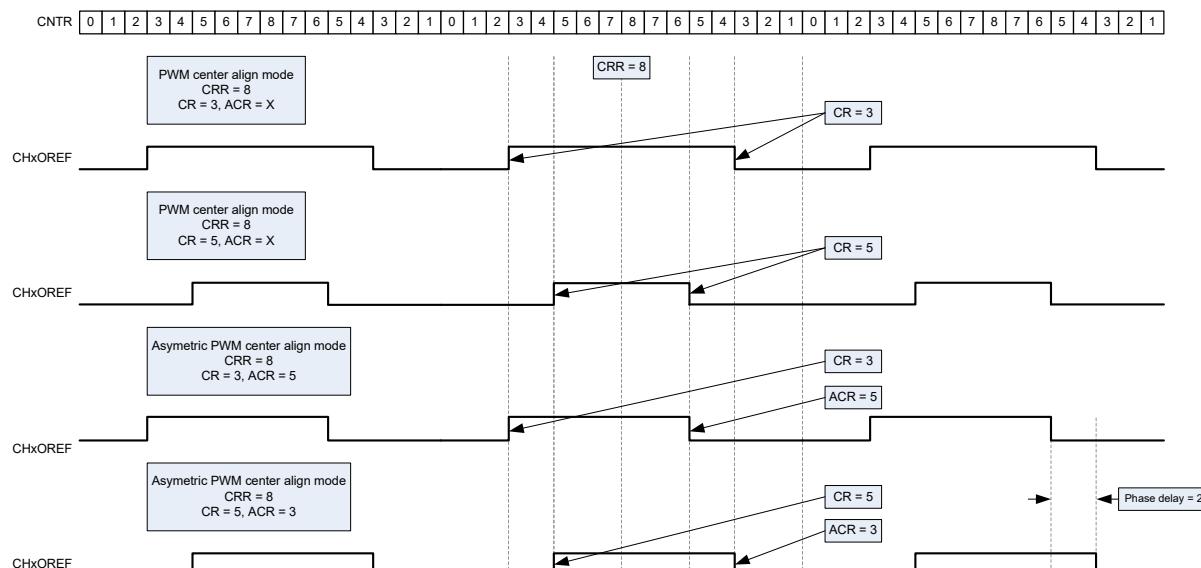

Figure 85. Asymmetric PWM Mode versus Center-aligned Counting Mode

Timer Interconnection

The timers can be internally connected together for timer chaining or synchronization. This can be implemented by configuring one timer to operate in the Master mode while configuring another timer to be in the Slave mode. The following figures present several examples of trigger selection for the master and slave modes.

Using one timer to enable / disable another timer start or stop counting

- Configure PWM0 as the master mode to send its channel 0 Output Reference signal CH0OREF as a trigger output (MMSEL = 0x4).
- Configure PWM0 CH0OREF waveform.
- Configure PWM1 to receive its input trigger source from the PWM0 trigger output (TRSEL = 0x9).
- Configure PWM1 to operate in the pause mode (SMSEL = 0x5).
- Enable PWM1 by writing ‘1’ to the TME bit.
- Enable PWM0 by writing ‘1’ to the TME bit.

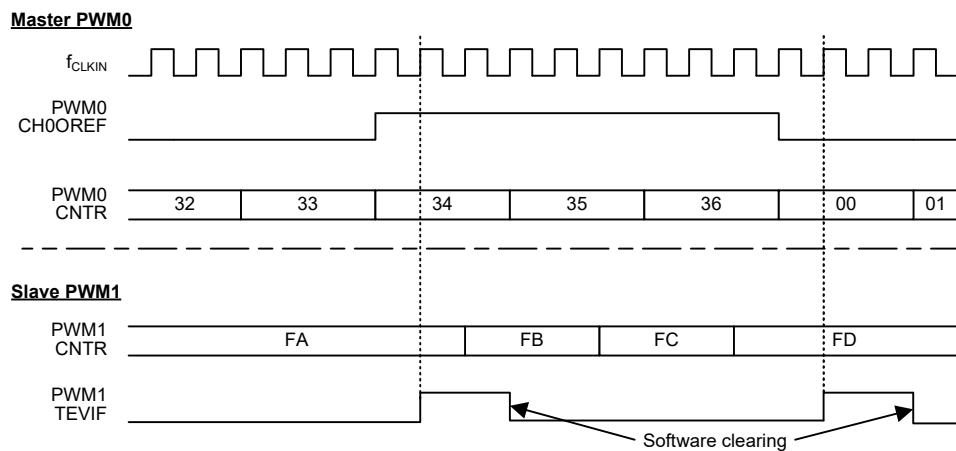

Figure 86. Pausing PWM1 using the PWM0 CH0OREF Signal

Using one timer to trigger another timer start counting

- Configure PWM0 to operate in the master mode to send its Update Event UEV as the trigger output (MMSEL = 0x2).
- Configure the PWM0 period by setting the CRR register.
- Configure PWM1 to get the input trigger source from the PWM0 trigger output (TRSEL = 0x9).
- Configure PWM1 to be in the slave trigger mode (SMSEL = 0x6).
- Start PWM0 by writing '1' to the TME bit.

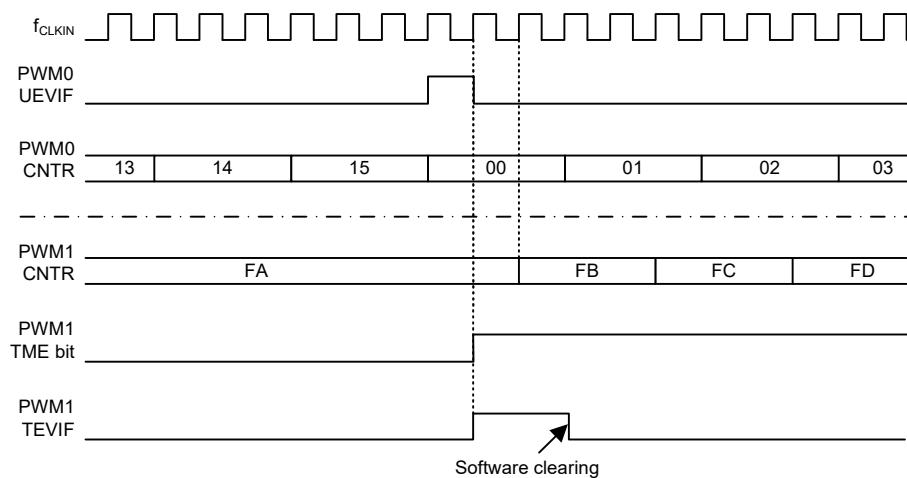

Figure 87. Triggering PWM1 with PWM0 Update Event

Starting two timers synchronously with the master enable MTO signal trigger

- Configure PWM0 to operate in the master mode to send its enable signal as a trigger output (MMSEL = 0x1).
- Enable the PWM0 master timer synchronization function by setting the TSE bit in the MDCFR register to 1 to synchronize the slave timer.
- Configure PWM1 to receive its input trigger source from the PWM0 trigger output (TRSEL = 0x9).
- Configure PWM1 to be in the slave trigger mode (SMSEL = 0x6).
- Set “1” to the PWM1 TME bit.
- Start PWM0 by writing ‘1’ to the TME bit.

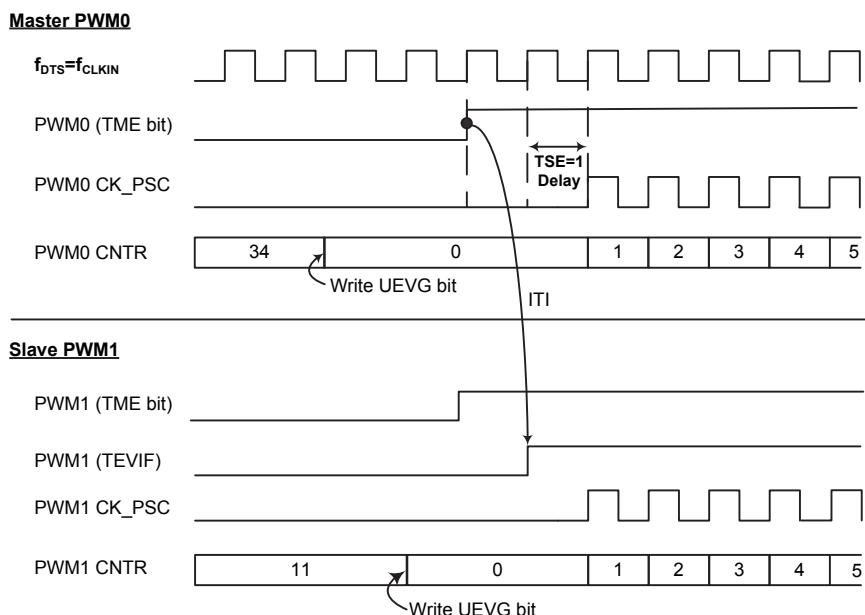

Figure 88. Trigger PWM0 and PWM1 with the PWM0 Timer Enable Signal

Trigger Peripherals Start

To interconnect to the peripherals, such as ADC, Timer and so on, the PWM could output the MTO signal or the channel compare match output signal CHxOREF ($x = 0 \sim 3$) to be used as peripherals input trigger signal, depending on the MCU specification.

Register Map

The following table shows the PWM registers and reset values.

Table 31. PWM Register Map

Register	Offset	Description	Reset Value
CNTCFR	0x000	Timer Counter Configuration Register	0x0000_0000

		011	—	Reserved
		100	Restart Mode	The counter value restarts from 0 or the CRR shadow register value depending upon the counter mode on the rising edge of the STI signal. The registers will also be updated.
		101	Pause Mode	The counter starts to count when the selected trigger input STI is high. The counter stops counting on the instant, not being reset, when the STI signal changes its state to a low level. Both the counter start and stop control are determined by the STI signal.
		110	Trigger Mode	The counter starts to count from the original value in the counter on the rising edge of the selected trigger input STI. Only the counter start control is determined by the STI signal.
		111	STIED	The rising edge of the selected trigger signal STI will clock the counter.
[0]	TSE	Timer Synchronization Enable		
		0: No action 1: Master timer (current timer) will generate a delay to synchronize its slave timer through the MTO signal		

Timer Trigger Configuration Register – TRCFR

This register specifies the trigger source selection of PWM.

Offset: 0x008

Reset value: 0x0000_0000

Bits	Field	Descriptions
[3:0]	TRSEL	<p>Trigger Source Selection</p> <p>These bits are used to select the trigger input (STI) for counter synchronization.</p> <ul style="list-style-type: none"> 0000: Software Trigger by setting the UEVG bit 1001: Internal Timing Module Trigger 0 (ITI0) 1010: Internal Timing Module Trigger 1 (ITI1) 1011: Internal Timing Module Trigger 2 (ITI2) Others: Reserved <p>Note: These bits must be updated only when they are not in use, i.e. the slave mode is disabled by setting the SMSEL field to 0x0.</p>

Table 32. PWM Internal Trigger Connection

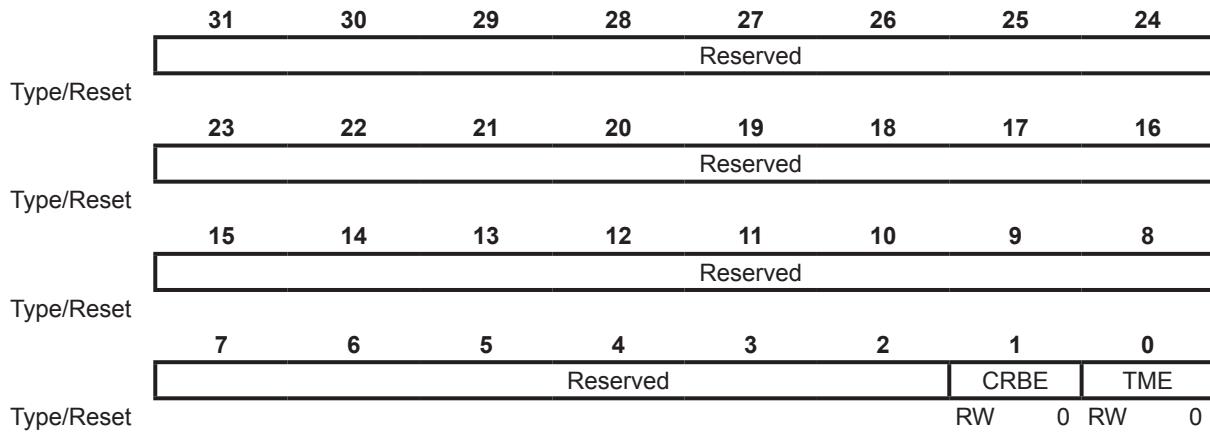

Slave Timing Module	ITI0	ITI1	ITI2
PWM0	PWM1	GPTM	—
PWM1	PWM0	GPTM	—

Timer Counter Register – CTR

This register specifies the timer enable bit (TME) and CRR buffer enable bit (CRBE).

Offset: 0x010

Reset value: 0x0000_0000

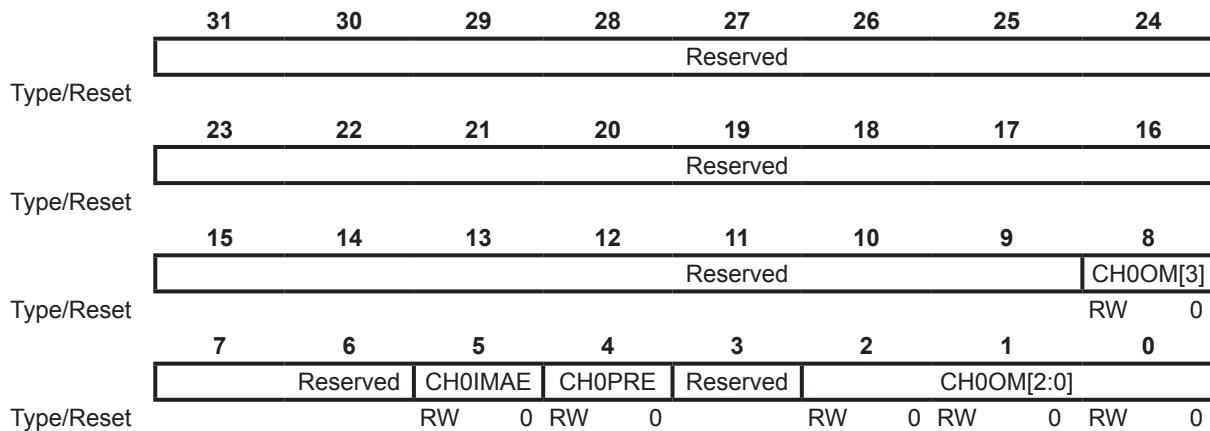

Bits	Field	Descriptions
[1]	CRBE	Counter Reload register Buffer Enable 0: Counter reload register can be updated immediately 1: Counter reload register can not be updated until the update event occurs
[0]	TME	Timer Enable bit 0: PWM off 1: PWM on When the TME bit is cleared to 0, the counter is stopped and the PWM consumes no power in any operation mode except for the single pulse mode and the slave trigger mode. In these two modes the TME bit can automatically be set to 1 by hardware which permits all the PWM registers to function normally.

Channel 0 Output Configuration Register – CH0OCFR

This register specifies the channel 0 output mode configuration.

Offset: 0x040

Reset value: 0x0000_0000

Bits	Field	Descriptions
[5]	CH0IMAE	<p>Channel 0 Immediate Active Enable</p> <p>0: No action 1: Single pulse Immediate Active Mode is enabled</p> <p>The CH0OREF will be forced to the compare matched level immediately after an available trigger event occurs irrespective of the result of the comparison between the CNTR and the CH0CR values.</p> <p>The effective duration ends automatically at the next overflow or underflow event.</p> <p>Note: The CH0IMAE bit is available only if the channel 0 is configured to be operated in the PWM mode 1 or PWM mode 2.</p>
[4]	CH0PRE	<p>Channel 0 Compare Register (CH0CR) Preload Enable</p> <p>0: CH0CR preload function is disabled The CH0CR register can be immediately assigned a new value when the CH0PRE bit is cleared to 0 and the updated CH0CR value is used immediately.</p> <p>1: CH0CR preload function is enabled The new CH0CR value will not be transferred to its shadow register until the update event occurs.</p>

Bits	Field	Descriptions
[8][2:0]	CH0OM[3:0]	<p>Channel 0 Output Mode Setting</p> <p>These bits define the functional types of the output reference signal CH0OREF.</p> <ul style="list-style-type: none"> 0000: No Change 0001: Output 0 on compare match 0010: Output 1 on compare match 0011: Output toggles on compare match 0100: Force inactive – CH0OREF is forced to 0 0101: Force active – CH0OREF is forced to 1 0110: PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 0 has an active level when CNTR < CH0CR or otherwise has an inactive level. - During down-counting, channel 0 has an inactive level when CNTR > CH0CR or otherwise has an active level. 0111: PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 0 has an inactive level when CNTR < CH0CR or otherwise has an active level. - During down-counting, channel 0 has an active level when CNTR > CH0CR or otherwise has an inactive level. 1100: Asymmetric PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 0 has an active level when CNTR < CH0CR or otherwise has an inactive level. - During down-counting, channel 0 has an inactive level when CNTR > CH0ACR or otherwise has an active level. 1110: Asymmetric PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 0 has an inactive level when CNTR < CH0CR or otherwise has an active level. - During down-counting, channel 0 has an active level when CNTR > CH0ACR or otherwise has an inactive level.

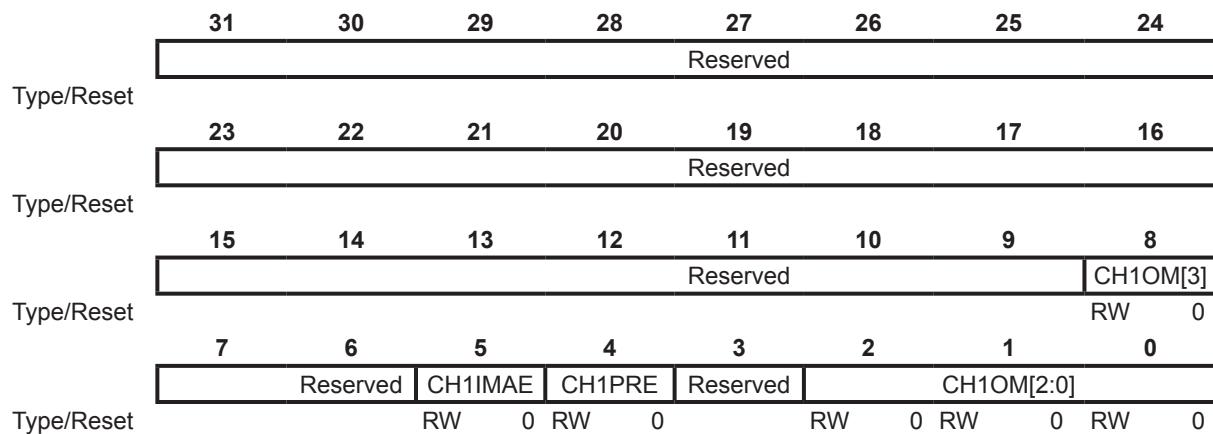

Note: When channel 0 is used as asymmetric PWM output mode, the Counter Mode Selection bit in Counter Configuration Register must be configured as Center-aligned Counting mode (CMSEL = 0x1 / 0x2 / 0x3)

Channel 1 Output Configuration Register – CH1OCFR

This register specifies the channel 1 output mode configuration.

Offset: 0x044

Reset value: 0x0000_0000

Bits	Field	Descriptions
[5]	CH1IMAE	<p>Channel 1 Immediate Active Enable</p> <p>0: No action</p> <p>1: Single pulse Immediate Active Mode is enabled</p> <p>The CH1OREF signal will be forced to the compare matched level immediately after an available trigger event occurs irrespective of the result of the comparison between the CNTR and the CH1CR values.</p> <p>The effective duration ends automatically at the next overflow or underflow event.</p> <p>Note: The CH1IMAE bit is available only if the channel 1 is configured to be operated in the PWM mode 1 or PWM mode 2.</p>
[4]	CH1PRE	<p>Channel 1 Compare Register (CH1CR) Preload Enable</p> <p>0: CH1CR preload function is disabled</p> <p>The CH1CR register can be immediately assigned a new value when the CH1PRE bit is cleared to 0 and the updated CH1CR value is used immediately.</p> <p>1: CH1CR preload function is enabled</p> <p>The new CH1CR value will not be transferred to its shadow register until the update event occurs.</p>

Bits	Field	Descriptions
[8][2:0]	CH1OM[3:0]	<p>Channel 1 Output Mode Setting</p> <p>These bits define the functional types of the output reference signal CH1OREF.</p> <ul style="list-style-type: none"> 0000: No Change 0001: Output 0 on compare match 0010: Output 1 on compare match 0011: Output toggles on compare match 0100: Force inactive – CH1OREF is forced to 0 0101: Force active – CH1OREF is forced to 1 0110: PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 1 has an active level when CNTR < CH1CR or otherwise has an inactive level. - During down-counting, channel 1 has an inactive level when CNTR > CH1CR or otherwise has an active level. 0111: PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 1 has an inactive level when CNTR < CH1CR or otherwise has an active level. - During down-counting, channel 1 has an active level when CNTR > CH1CR or otherwise has an inactive level. 1110: Asymmetric PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 1 has an active level when CNTR < CH1CR or otherwise has an inactive level. - During down-counting, channel 1 has an inactive level when CNTR > CH1ACR or otherwise has an active level. 1111: Asymmetric PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 1 has an inactive level when CNTR < CH1CR or otherwise has an active level. - During down-counting, channel 1 has an active level when CNTR > CH1ACR or otherwise has an inactive level.

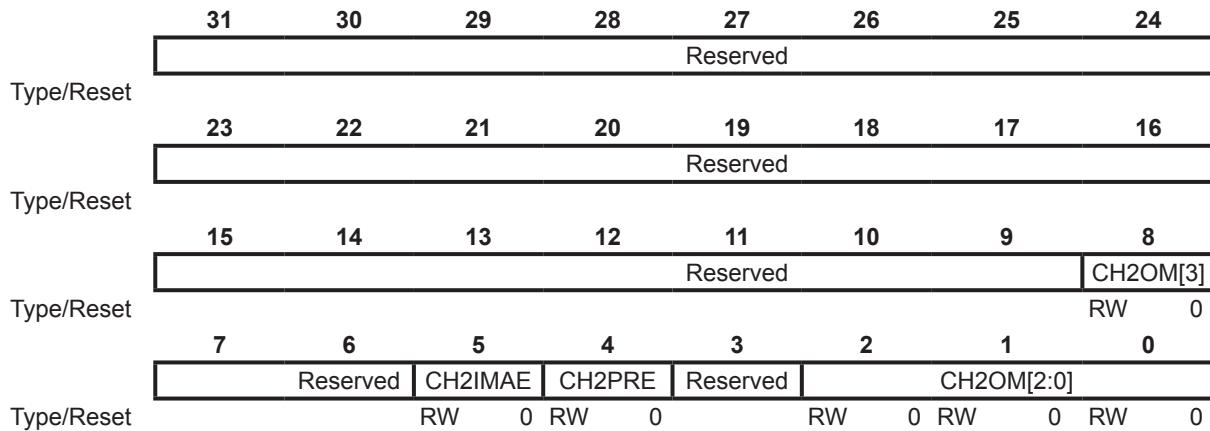

Note: When channel 1 is used as asymmetric PWM output mode, the Counter Mode Selection bit in Counter Configuration Register must be configured as Center-aligned Counting mode (CMSEL = 0x1 / 0x2 / 0x3)

Channel 2 Output Configuration Register – CH2OCFR

This register specifies the channel 2 output mode configuration.

Offset: 0x048

Reset value: 0x0000_0000

Bits	Field	Descriptions
[5]	CH2IMAE	<p>Channel 2 Immediate Active Enable</p> <p>0: No action 1: Single pulse Immediate Active Mode is enabled The CH2OREF signal will be forced to the compare matched level immediately after an available trigger event occurs irrespective of the result of the comparison between the CNTR and the CH2CR values. The effective duration ends automatically at the next overflow or underflow event. Note: The CH2IMAE bit is available only if the channel 2 is configured to be operated in the PWM mode 1 or PWM mode 2.</p>
[4]	CH2PRE	<p>Channel 2 Compare Register (CH2CR) Preload Enable</p> <p>0: CH2CR preload function is disabled The CH2CR register can be immediately assigned a new value when the CH2PRE bit is cleared to 0 and the updated CH2CR value is used immediately. 1: CH2CR preload function is enabled The new CH2CR value will not be transferred to its shadow register until the update event occurs.</p>

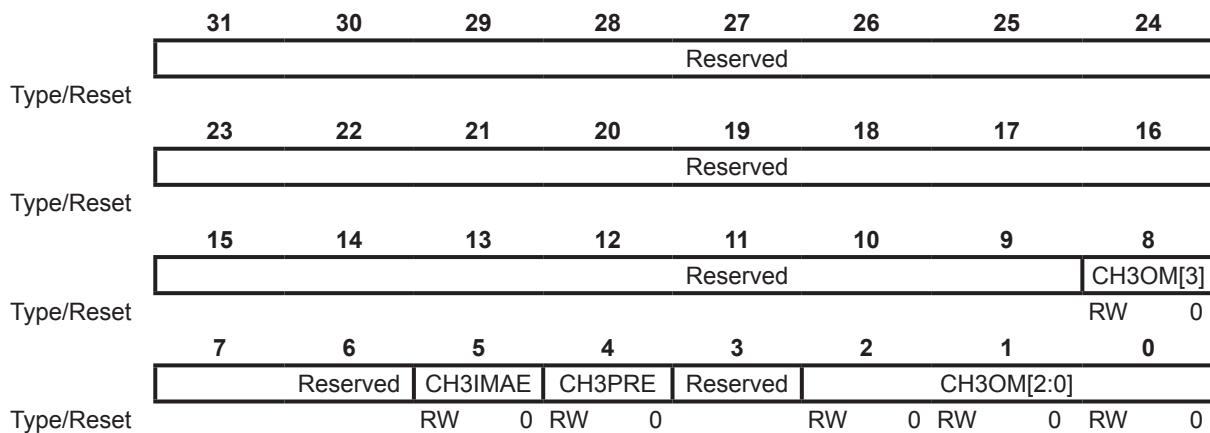

Bits	Field	Descriptions
[8][2:0]	CH2OM[3:0]	<p>Channel 2 Output Mode Setting</p> <p>These bits define the functional types of the output reference signal CH2OREF.</p> <ul style="list-style-type: none"> 0000: No Change 0001: Output 0 on compare match 0010: Output 1 on compare match 0011: Output toggles on compare match 0100: Force inactive – CH2OREF is forced to 0 0101: Force active – CH2OREF is forced to 1 0110: PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 2 has an active level when CNTR < CH2CR or otherwise has an inactive level. - During down-counting, channel 2 has an inactive level when CNTR > CH2CR or otherwise has an active level. 0111: PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 2 has an inactive level when CNTR < CH2CR or otherwise has an active level. - During down-counting, channel 2 has an active level when CNTR > CH2CR or otherwise has an inactive level. 1110: Asymmetric PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 2 has an active level when CNTR < CH2CR or otherwise has an inactive level. - During down-counting, channel 2 has an inactive level when CNTR > CH2ACR or otherwise has an active level. 1111: Asymmetric PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 2 has an inactive level when CNTR < CH2CR or otherwise has an active level. - During down-counting, channel 2 has an active level when CNTR > CH2ACR or otherwise has an inactive level.
		<p>Note: When channel 2 is used as asymmetric PWM output mode, the Counter Mode Selection bit in Counter Configuration Register must be configured as Center-aligned Counting mode (CMSEL = 0x1 / 0x2 / 0x3)</p>

Channel 3 Output Configuration Register – CH3OCFR

This register specifies the channel 3 output mode configuration.

Offset: 0x04C

Reset value: 0x0000_0000

Bits	Field	Descriptions
[5]	CH3IMAE	<p>Channel 3 Immediate Active Enable</p> <p>0: No action 1: Single pulse Immediate Active Mode is enabled The CH3OREF signal will be forced to the compare matched level immediately after an available trigger event occurs irrespective of the result of the comparison between the CNTR and the CH3CR values. The effective duration ends automatically at the next overflow or underflow event. Note: The CH3IMAE bit is available only if the channel 3 is configured to be operated in the PWM mode 1 or PWM mode 2.</p>
[4]	CH3PRE	<p>Channel 3 Compare Register (CH3CR) Preload Enable</p> <p>0: CH3CR preload function is disabled The CH3CR register can be immediately assigned a new value when the CH3PRE bit is cleared to 0 and the updated CH3CR value is used immediately. 1: CH3CR preload function is enabled The new CH3CR value will not be transferred to its shadow register until the update event occurs.</p>

Bits	Field	Descriptions
[8][2:0]	CH3OM[3:0]	<p>Channel 3 Output Mode Setting</p> <p>These bits define the functional types of the output reference signal CH3OREF</p> <ul style="list-style-type: none"> 0000: No Change 0001: Output 0 on compare match 0010: Output 1 on compare match 0011: Output toggles on compare match 0100: Force inactive – CH3OREF is forced to 0 0101: Force active – CH3OREF is forced to 1 0110: PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 3 has an active level when CNTR < CH3CR or otherwise has an inactive level. - During down-counting, channel 3 has an inactive level when CNTR > CH3CR or otherwise has an active level. 0111: PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 3 has an inactive level when CNTR < CH3CR or otherwise has an active level. - During down-counting, channel 3 has an active level when CNTR > CH3CR or otherwise has an inactive level 1110: Asymmetric PWM mode 1 <ul style="list-style-type: none"> - During up-counting, channel 3 has an active level when CNTR < CH3CR or otherwise has an inactive level. - During down-counting, channel 3 has an inactive level when CNTR > CH3ACR or otherwise has an active level. 1111: Asymmetric PWM mode 2 <ul style="list-style-type: none"> - During up-counting, channel 3 has an inactive level when CNTR < CH3CR or otherwise has an active level. - During down-counting, channel 3 has an active level when CNTR > CH3ACR or otherwise has an inactive level <p>Note: When channel 3 is used as asymmetric PWM output mode, the Counter Mode Selection bit in Counter Configuration Register must be configured as Center-aligned Counting mode (CMSEL = 0x1 / 0x2 / 0x3)</p>

Channel Control Register – CHCTR

This register contains the channel compare output function enable control bits.

Offset: 0x050

Reset value: 0x0000_0000

Timer Event Generator Register – EVGR

This register contains the software event generation bits.

Offset: 0x078

Reset value: 0x0000_0000

Bits	Field	Descriptions
[10]	TEVG	<p>Trigger Event Generation</p> <p>The trigger event TEV can be generated by setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: TEVIF flag is set</p>
[8]	UEVG	<p>Update Event Generation</p> <p>The update event UEV can be generated by setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: Reinitialize the counter</p> <p>The counter value returns to 0 or the CRR preload value, depending on the counter mode in which the current timer is being used. An update operation of any related registers will also be performed. For more detailed descriptions, refer to the corresponding section.</p>
[3]	CH3CG	<p>Channel 3 Compare Generation</p> <p>A Channel 3 compare event can be generated by software setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: Compare event is generated on channel 3</p>
[2]	CH2CG	<p>Channel 2 Compare Generation</p> <p>A Channel 2 compare event can be generated by software setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: Compare event is generated on channel 2</p>
[1]	CH1CG	<p>Channel 1 Compare Generation</p> <p>A Channel 1 compare event can be generated by software setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: Compare event is generated on channel 1</p>

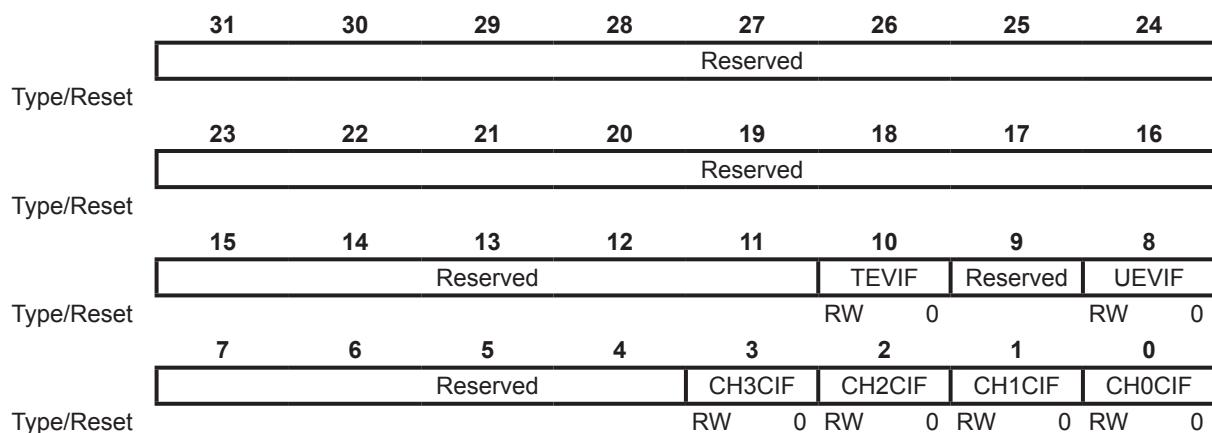

Bits	Field	Descriptions
[0]	CH0CG	<p>Channel 0 Compare Generation A Channel 0 compare event can be generated by software setting this bit. It is cleared by hardware automatically.</p> <p>0: No action 1: Compare event is generated on channel 0</p>

Timer Interrupt Status Register – INTSR

This register stores the timer interrupt status.

Offset: 0x07C

Reset value: 0x0000_0000

Bits	Field	Descriptions
[10]	TEVIF	<p>Trigger Event Interrupt Flag This flag is set by hardware on a trigger event and is cleared by software.</p> <p>0: No trigger event occurs 1: Trigger event occurs</p>
[8]	UEVIF	<p>Update Event Interrupt Flag This bit is set by hardware on an update event and is cleared by software.</p> <p>0: No update event occurs 1: Update event occurs</p> <p>Note: The update event is derived from the following conditions:</p> <ul style="list-style-type: none"> - The counter overflows or underflows - The UEVG bit is asserted - A restart trigger event occurs from the slave trigger input
[3]	CH3CIF	<p>Channel 3 Compare Interrupt Flag 0: No match event occurs 1: The content of the counter CNTR has matched the contents of the CH3CR register This flag is set by hardware when the counter value matches the CH3CR value except in the center-aligned mode. It is cleared by software.</p>

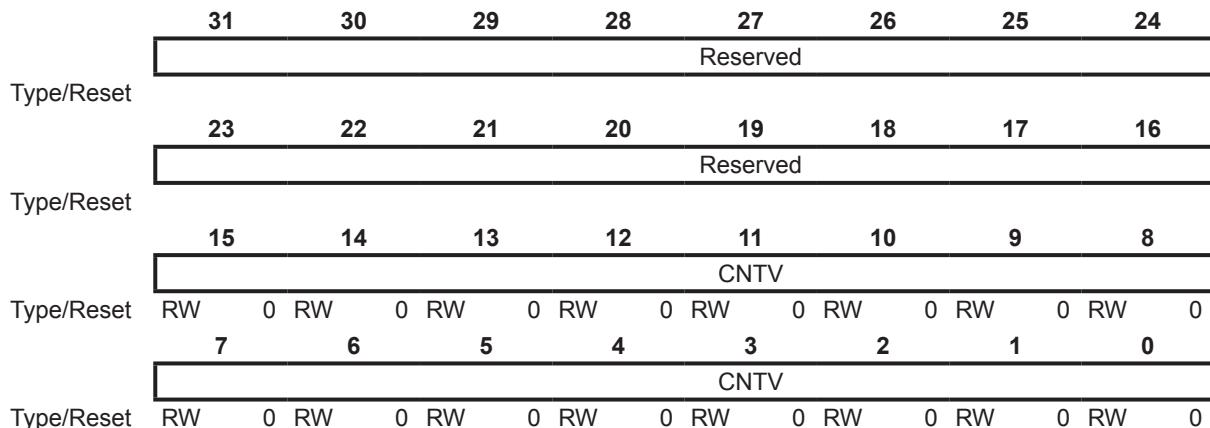

Bits	Field	Descriptions
[2]	CH2CIF	Channel 2 Compare Interrupt Flag 0: No match event occurs 1: The content of the counter CNTR has matched the contents of the CH2CR register This flag is set by hardware when the counter value matches the CH2CR value except in the center-aligned mode. It is cleared by software.
[1]	CH1CIF	Channel 1 Compare Interrupt Flag 0: No match event occurs 1: The content of the counter CNTR has matched the contents of the CH1CR register This flag is set by hardware when the counter value matches the CH1CR value except in the center-aligned mode. It is cleared by software.
[0]	CH0CIF	Channel 0 Compare Interrupt Flag 0: No match event occurs 1: The content of the counter CNTR has matched the content of the CH0CR register This flag is set by hardware when the counter value matches the CH0CR value except in the center-aligned mode. It is cleared by software.

Timer Counter Register – CNTR

This register stores the timer counter value.

Offset: 0x080

Reset value: 0x0000_0000

Bits	Field	Descriptions
[15:0]	CNTV	Counter Value

Timer Prescaler Register – PSCR

This register specifies the timer prescaler value to generate the counter clock.

Offset: 0x084

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24	
Type/Reset	Reserved

15 Basic Function Timer (BFTM)

Introduction

The Basic Function Timer Module, BFTM, is a 32-bit up-counting counter designed to measure time intervals, generate one shot pulses or generate repetitive interrupts. The BFTM can operate in two modes which are repetitive and one shot modes. The repetitive mode restarts the counter at each compare match event which is generated by the internal comparator. The BFTM also supports a one shot mode which will force the counter to stop counting when a compare match occurs.

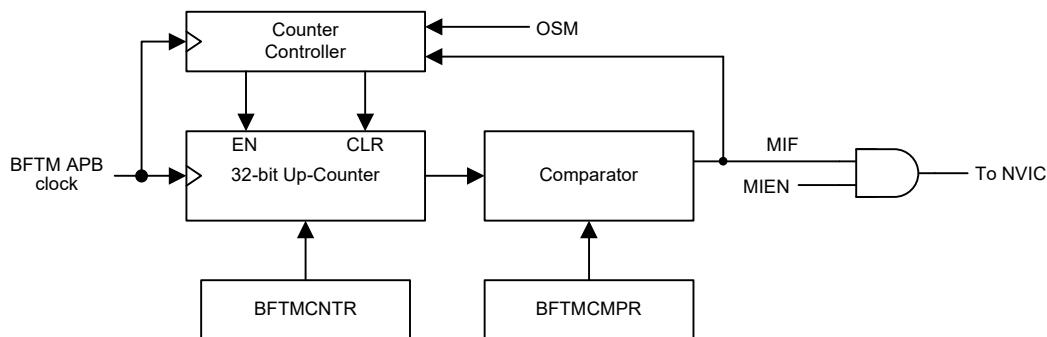

Figure 89. BFTM Block Diagram

Features

- 32-bit up-counting counter
- Compare Match function
- Includes debug mode
- Clock source: BFTM APB clock
- Counter value can be R/W on the fly
- One shot mode: counter stops counting when compare match occurs
- Repetitive mode: counter restarts when compare match occurs
- Compare Match interrupt enable / disable control

Functional Description

The BFTM is a 32-bit up-counting counter which is driven by the BFTM APB clock, PCLK. The counter value can be changed or read at any time even when the timer is counting. The BFTM supports two operating modes known as the repetitive mode and one shot mode allowing the measurement of time intervals or the generation of periodic time durations.

Repetitive Mode

The BFTM counts up from zero to a specific compare value which is pre-defined by the BFTMCMPR register. When the BFTM operates in the repetitive mode and the counter reaches a value equal to the specific compare value in the BFTMCMPR register, the timer will generate a compare match event signal, MIF. When this occurs, the counter will be reset to 0 and resume its counting operation. When the MIF signal is generated, a BFTM compare match interrupt will also be generated periodically if the compare match interrupt is enabled by setting the corresponding interrupt control bit, MIEN, to 1. The counter value will remain unchanged and the counter will stop counting if it is disabled by clearing the CEN bit to 0.

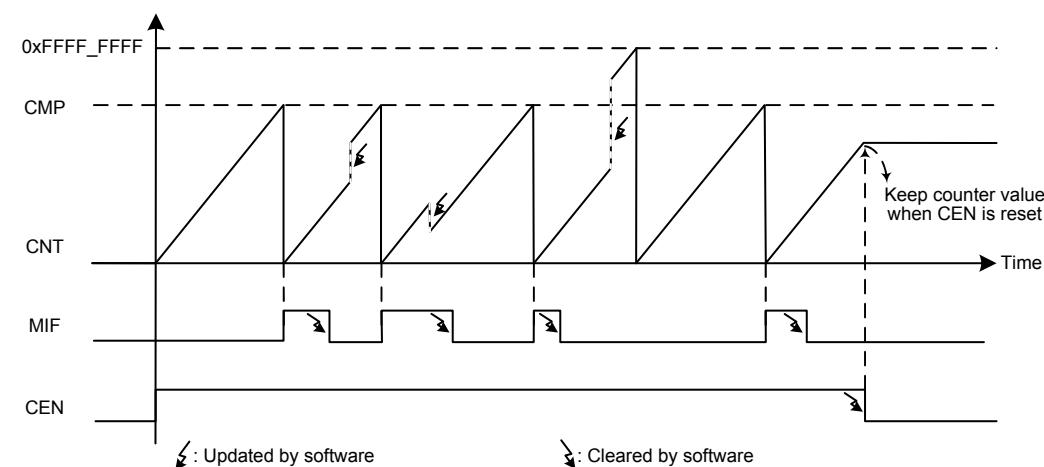

Figure 90. BFTM – Repetitive Mode

One Shot Mode

By setting the OSM bit in BFTMCR register to 1, the BFTM will operate in the one shot mode. The BFTM starts to count when the CEN bit is set to 1 by the application program. The counter value will remain unchanged if the CEN bit is cleared to 0 by the application program. However, the counter value will be reset to 0 and stop counting when the CEN bit is cleared automatically to 0 by the internal hardware when a counter compare match event occurs.

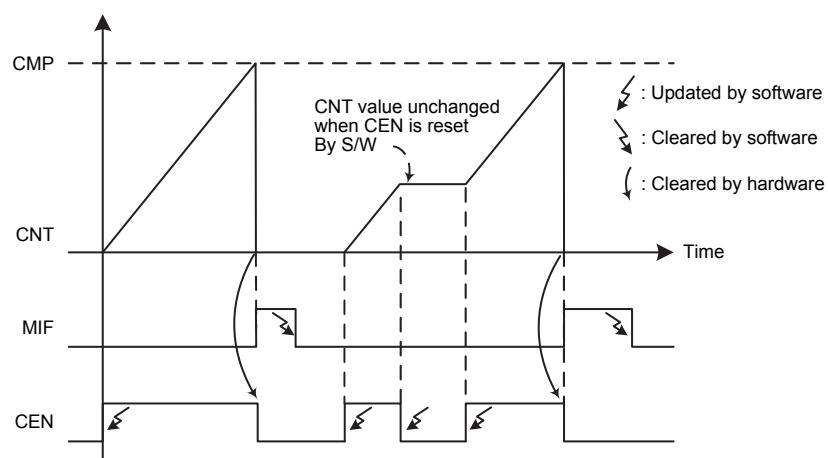

Figure 91. BFTM – One Shot Mode

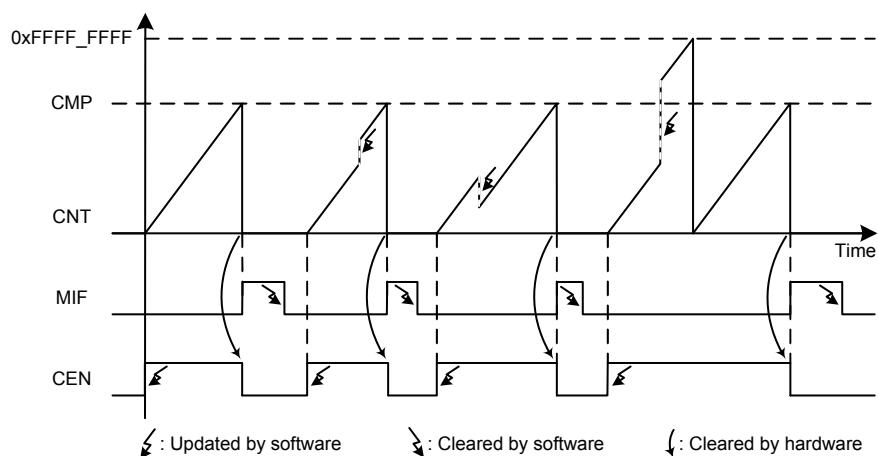

Figure 92. BFTM – One Shot Mode Counter Updating

Trigger ADC Start

When a BFTM compare match event occurs, a compare match interrupt flag, MIF, will be generated which can be used as an A/D Converter input trigger source.

Register Map

The following table shows the BFTM registers and their reset values.

Table 33. BFTM Register Map

Register	Offset	Description	Reset Value
BFTMCR	0x000	BFTM Control Register	0x0000_0000
BFTMSR	0x004	BFTM Status Register	0x0000_0000

16 Real Time Clock (RTC)

Introduction

The Real Time Clock, RTC, circuitry includes the APB interface, a 24-bit up-counter, a control register, a prescaler, a compare register and a status register. The RTC circuits are located in the V_{DD15} Domain, as shown shaded in the accompanying figure. The RTC counter is used as a wakeup timer to let the system resume from the power saving mode. The detailed RTC function will be described in the following sections.

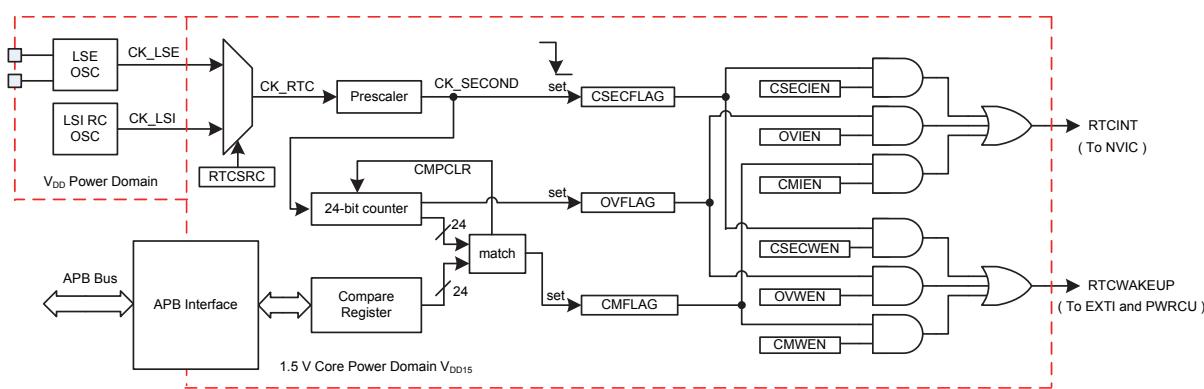

Figure 93. RTC Block Diagram

Features

- 24-bit up counter for counting elapsed time
- Programmable clock prescaler
 - Division factor: 1, 2, 4, 8..., 32768
- 24-bit compare register for alarm usage
- RTC clock source
 - LSE oscillator clock
 - LSI oscillator clock
- Three RTC Interrupt / wakeup settings
 - RTC second clock interrupt / wakeup
 - RTC compare match interrupt / wakeup
 - RTC counter overflow interrupt / wakeup
- The RTC interrupt / wakeup event can work together with power management to wake up the chip from power saving mode

Functional Descriptions

RTC Related Register Reset

The RTC registers can only be reset by either a V_{DDIS} Domain power on reset, POR15, or by a PWRCU software reset by setting the PWCURST bit in the PWRCR register. Other reset events have no effect to clear the RTC registers.

Low Speed Clock Configuration

The default RTC clock source, CK_RTC, is derived from the LSI oscillator. The CK_RTC clock can be derived from either the external 32,768 Hz crystal oscillator, named the LSE oscillator, or the internal 32 kHz RC oscillator named the LSI oscillator, by setting the RTCSRC bit in the RTCCR register. A prescaler is provided to divide the CK_RTC by a ratio ranged from 2⁰ to 2¹⁵ determined by the RPREG [3:0] field. For instance, setting the prescaler value RPREG [3:0] to 0xF will generate an exact 1 Hz CK_SECOND clock if the CK_RTC clock frequency is equal to 32,768 Hz. The LSE oscillator can be enabled by the LSEEN control bits in the RTCCR register. In addition, the LSE oscillator startup mode can be selected by configuring the LSESM bit in the RTCCR register. This enables the LSE oscillator to have either a shorter startup time or a lower power consumption, both of which are traded off depending upon specific application requirements. An example of the startup time and the power consumption for different startup modes are shown in the accompanying table for reference.

Table 34. LSE Startup Mode Operating Current and Startup Time

Startup Mode	LSESM Setting in the RTCCR Register	Operating Current	Startup Time
Normal startup	0	2.0 μ A	Above 500 ms
Fast startup	1	3.5 μ A	Below 300 ms

@ V_{DD} = 3.3 V and LSE clock = 32,768 Hz; these values are only for reference, actual values are dependent on the specification of the external 32.768 kHz crystal.

RTC Counter Operation

The RTC provides a 24-bit up-counter which increments at the falling edge of the CK_SECOND clock and whose value can be read from the RTCCNT register asynchronously via the APB bus. A 24-bit compare register, RTCCMP, is provided to store the specific value to be compared with the RTCCNT content. This is used to define a pre-determined time interval. When the RTCCNT register content is equal to the RTCCMP register value, the match flag CMFLAG in the RTCSR register will be set by hardware and an interrupt or wakeup event can be sent according to the corresponding enable bits in the RTCIWIN register. The RTC counter will be either reset to zero or keep counting when the compare match event occurs, dependent upon the CMPCLR bit in the RTCCR register. For example, if the RPREG [3:0] is set to 0xF, the RTCCMP register content is set to a decimal value of 60 and the CMPCLR bit is set to 1, then the CMFLAG bit will be set every minute. In addition, the OVFLAG bit in the RTCSR register will be set when the RTC counter overflows. A read operation on the RTCSR register clears the status flags including the CSECFLAG, CMFLAG and OVFLAG bits.

Interrupt and Wakeup Control

The falling edge of the CK_SECOND clock causes the CSECFLAG bit in the RTCSR register to be set and generates an interrupt if the corresponding interrupt enable bit, CSECIEN, in the RTCIWIN register is set. The wakeup event can also be generated to wake up the HSI / HSE

oscillators, the LDO and the CPU core if the corresponding wakeup enable bit CSECWEN is set. When the RTC counter overflows or a compare match event occurs, it will generate an interrupt or a wake up event determined by the corresponding interrupt or wakeup enable control bits, OVIEN / OVWEN or CMIEN / CMWEN bits, in the RTCIWEN register. Refer to the related register definitions for more details.

RTCOUT Output Pin Configuration

The following table shows RTCOUT output format according to the mode, polarity and event selection setting.

Table 35. RTCOUT Output Mode and Active Level Setting

ROWM	ROES	RTCOUT Output Waveform				
0 (Pulse mode)	0 Compare match	RTCCMP	4

17 Watchdog Timer (WDT)

Introduction

The Watchdog timer is a hardware timing circuitry that can be used to detect a system lock-up due to software trapped in a deadlock. The Watchdog timer can be operated in a reset mode. The Watchdog timer will generate a reset when the counter counts down to a zero value. Therefore, the software should reload the counter value before a Watchdog timer underflow occurs. In addition, a reset is also generated if the software reloads the counter before it reaches a delta value. That means that the Watchdog timer prevents a software deadlock that continuously triggers the Watchdog, the reload must occur when the Watchdog timer value has a value within a limited window of 0 and WDTD. The Watchdog timer counter can be stopped when the processor is in the debug or sleep mode. The register write protection function can be enabled to prevent an unexpected change in the Watchdog timer configuration.

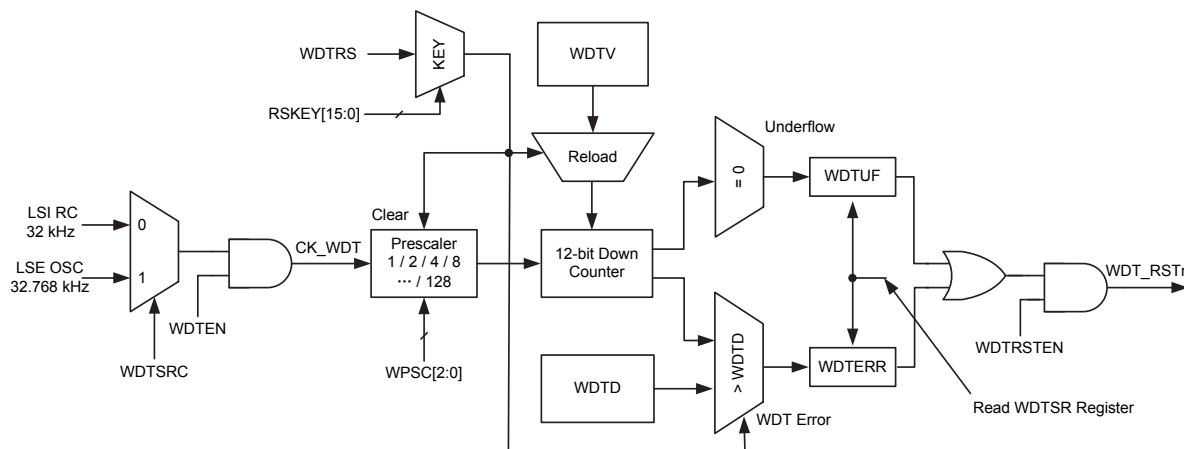

Figure 94. Watchdog Timer Block Diagram

Features

- Clock source from either internal 32 kHz RC oscillator (LSI) or external 32,768 Hz oscillator (LSE)
- Can be independently setup to keep running or to stop when entering the Sleep mode or Deep-Sleep1 mode
- 12-bit down-counter with 3-bit prescaler structure
- Provides reset to the system
- Limited reload window setup function for custom Watchdog timer reload times
- Watchdog Timer may be stopped when the processor is in the debug
- Reload lock key to prevent unexpected operation
- Configuration register write protection function for counter value, reset enable, delta value and prescaler value

Functional Description

The Watchdog timer is formed from a 12-bit count-down counter and a fixed 3-bit prescaler. The largest time-out period is 16 seconds, using the LSE or LSI clock and a 1/128 maximum prescaler value.

The Watchdog timer configuration setup includes programmable counter reload value, reset enable, window value and prescaler value. These configurations are set using the WDTMR0 and WDTMR1 registers which must be properly programmed before the Watchdog timer starts counting. In order to prevent unexpected write operations to those configurations, a register write protection function can be enabled by writing any value, other than 0x35CA to PROTECT[15:0], in the WDTPR register. A value of 0x35CA can be written to PROTECT[15:0] to disable the register write protection function before accessing any configuration register. A read operation on PROTECT[0] can obtain the enable / disable status of the register write protection function.

During normal operation, the Watchdog timer counter should be reloaded before it underflows to prevent the generation of a Watchdog reset. The 12-bit count-down counter can be reloaded with the required Watchdog Timer Counter Value (WDTV) by first setting the WDTRS bit to 1 with the correct key, which is 0x5FA0 in the WDTCR register.

If a software deadlock occurs during a Watchdog timer reload routine, the reload operation will still go ahead and therefore the software deadlock cannot be detected. To prevent this situation from occurring, the reload operation must be executed in such a way that the value of the Watchdog timer counter is limited within a delta value (WDTD). If the Watchdog timer counter value is greater than the delta value and a reload operation is executed, a Watchdog Timer error will occur. The Watchdog timer error will generate a Watchdog reset if the related functional control is enabled. Additionally, the above features can be disabled by programming a WDTD value greater than or equal to the WDTV value.

The WDTERR and WDTUF flags in the WDTSR register will be set respectively when the Watchdog timer underflows or when a Watchdog timer error occurs. A system reset or write-one operation on the WDTSR register clears the WDTERR and WDTUF flags.

The watchdog timer uses two clocks: PCLK and CK_WDT. The PCLK clock is used for APB access to the watchdog registers. The CK_WDT clock is used for the Watchdog timer functionality and counting. There is some synchronization logic between these two clock domains.

When the system enters the Sleep mode or Deep-Sleep1 mode, the Watchdog timer counter will either continue to count or stop depending on the WDTSHLT bits in the WDTMR0 register. However, the Watchdog Timer will always stop when the system is in the Deep-Sleep2 mode. When the Watchdog stops counting, the count value is retained so that it continues counting after the system is woken up from these three Sleep modes. A Watchdog reset will occur any time when the Watchdog timer is running and when it has an operating clock source. When the system enters the debug mode, the Watchdog timer counter will either continue to count or stop depending on the DBWDT bit (in the MCUDBGCR register) in the Clock Control Unit.

The Watchdog timer should be used in the following manners:

- Set the Watchdog timer reload value (WDTV) and reset in the WDTMR0 register.
- Set the Watchdog timer delta value (WDTD) and prescaler in the WDTMR1 register.
- Start the Watchdog timer by writing to the WDTCR register with WDTRS = 1 and RSKEY = 0x5FA0.
- Write to the WDTPR register to lock all the Watchdog timer registers except for WDTCR and WDTPR.
- The Watchdog timer counter should be reloaded again within the delta value (WDTD).

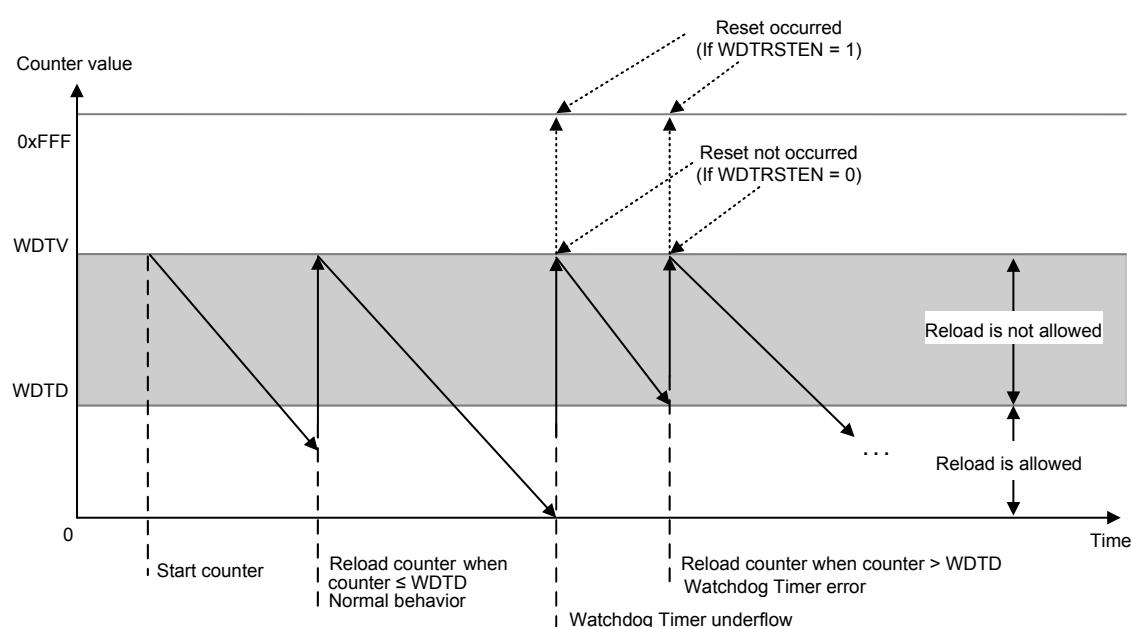

Figure 95. Watchdog Timer Behavior

Register Map

The following table shows the Watchdog Timer registers and reset values.

Table 37. Watchdog Timer Register Map

Register	Offset	Description	Reset Value
WDTCR	0x000	Watchdog Timer Control Register	0x0000_0000
WDTMR0	0x004	Watchdog Timer Mode Register 0	0x0000_0FFF
WDTMR1	0x008	Watchdog Timer Mode Register 1	0x0000_5FFF
WDTSR	0x00C	Watchdog Timer Status Register	0x0000_0000
WDTPR	0x010	Watchdog Timer Protection Register	0x0000_0000
WDTCSR	0x018	Watchdog Timer Clock Selection Register	0x0000_0000

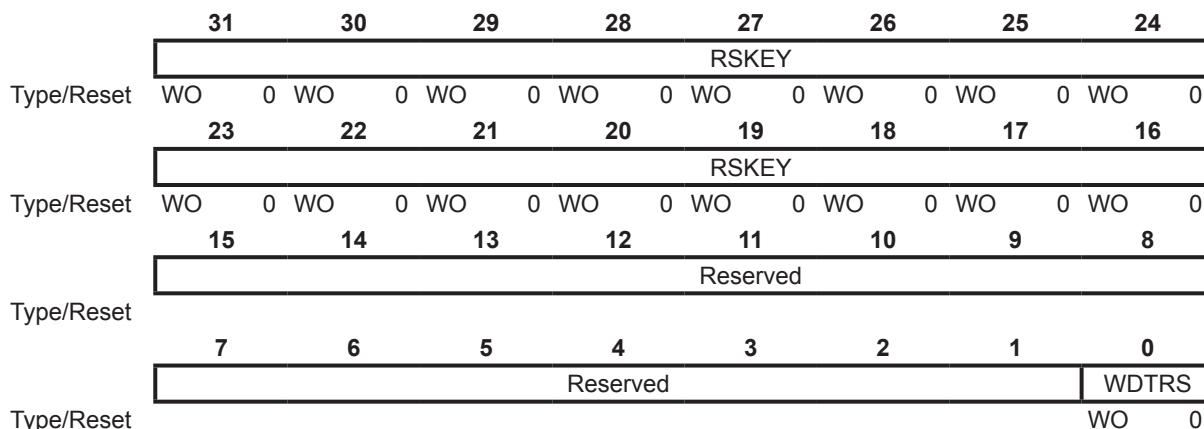

Register Descriptions

Watchdog Timer Control Register – WDTCR

This register is used to reload the Watchdog timer.

Offset: 0x000

Reset value: 0x0000_0000

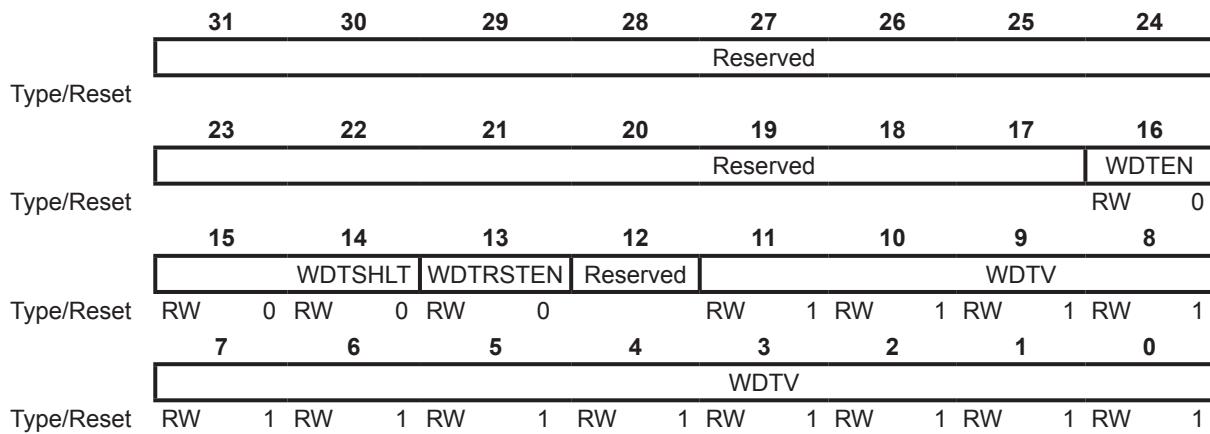

Bits	Field	Descriptions
[31:16]	RSKEY	Watchdog Timer Reload Lock Key The RSKEY [15:0] bits should be written with a 0x5FA0 value to enable the WDT reload operation function. Writing any other value except 0x5FA0 in this field will abort the write operation.
[0]	WDTRS	Watchdog Timer Reload 0: No effect 1: Reload Watchdog Timer This bit is used to reload the Watchdog timer counter as a WDTV value which is stored in the WDTMR0 register. It is set to 1 by software and cleared to 0 by hardware automatically.

Watchdog Timer Mode Register 0 – WDTMR0

This register specifies the Watchdog timer counter reload value and reset enable control.

Offset: 0x004

Reset value: 0x0000_0FFF

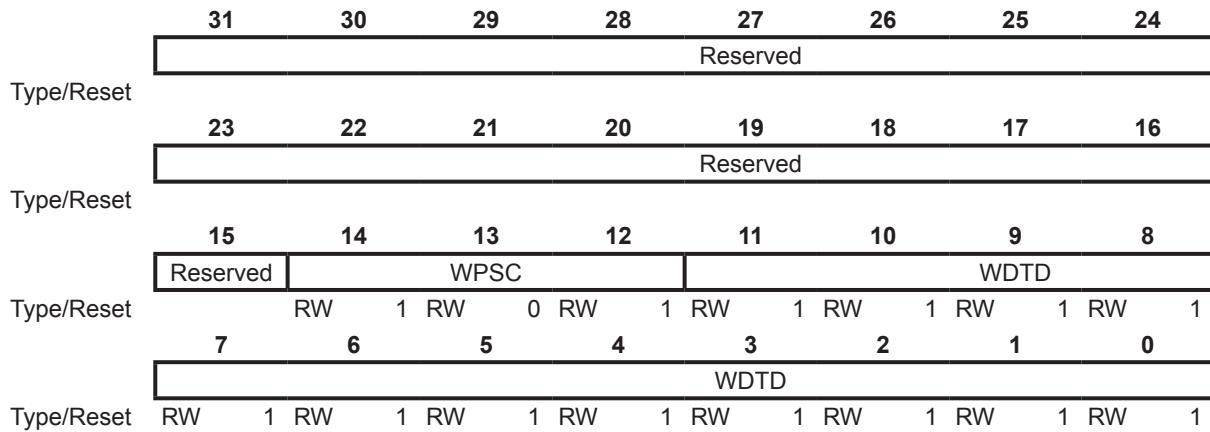

Bits	Field	Descriptions
[16]	WDTEN	Watchdog Timer Running Enable 0: Watchdog timer is disabled 1: Watchdog timer is enabled to run When the Watchdog timer is disabled, the counter will be reset to its hardware default condition. When the WDTEN bit is set, the Watchdog timer will be reloaded with the WDTV value and count down.
[15:14]	WDTSHLT	Watchdog Timer Sleep Halt 00: The Watchdog runs when the system is in the Sleep mode or Deep-Sleep1 mode 01: The Watchdog runs when the system is in the Sleep mode and halts in Deep-Sleep1 mode 10 or 11: The Watchdog halts when the system is in the Sleep mode and Deep-Sleep1 mode Note that the Watchdog timer always halts when the system is in Deep-Sleep2 mode. The Watchdog stops counting when the WDTSHLT bits are properly configured in the Sleep mode or Deep-Sleep1 mode, the count value is retained so that it continues counting after the system wakes up from these three Sleep modes. If a Watchdog reset occurs in Sleep mode or Deep-Sleep1 mode, it will wake up the device.
[13]	WDTRSTEN	Watchdog Timer Reset Enable 0: A Watchdog Timer underflow or error has no effect on the reset of system 1: A Watchdog Timer underflow or error triggers a Watchdog timer system reset
[11:0]	WDTV	Watchdog Timer Counter Value WDTV defines the value loaded into the 12-bit Watchdog down-counter.

Watchdog Timer Mode Register 1 – WDTMR1

This register specifies the Watchdog delta value and the prescaler selection.

Offset: 0x008

Reset value: 0x0000_5FFF

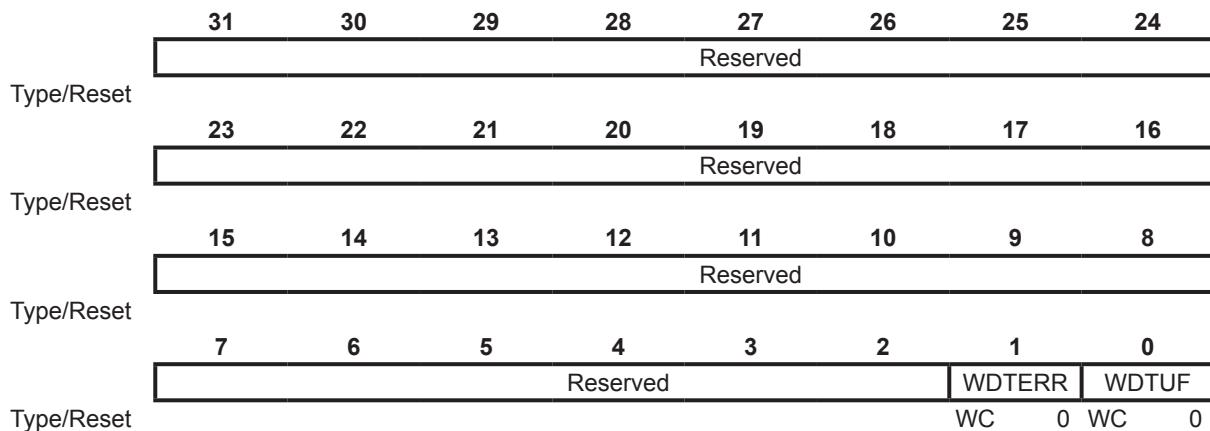

Bits	Field	Descriptions
[14:12]	WPSC	Watchdog Timer Prescaler Selection 000: 1/1 001: 1/2 010: 1/4 011: 1/8 100: 1/16 101: 1/32 110: 1/64 111: 1/128
[11:0]	WDTD	Watchdog Timer Delta Value Define the permitted range to reload the Watchdog timer. If the Watchdog timer counter value is less than or equal to WDTD, writing to the WDTCR register with WDTRS = 1 and RSKEY = 0x5FA0 will reload the timer. If the Watchdog Timer value is greater than WDTD, then writing WDTCR with WDTRS = 1 and RSKEY = 0x5FA0 will cause a Watchdog Timer error. This feature can be disabled by programming a WDTD value greater than or equal to the WDTV value.

Watchdog Timer Status Register – WDTSR

This register specifies the Watchdog timer status.

Offset: 0x00C

Reset value: 0x0000_0000

Bits	Field	Descriptions
[1]	WDTERR	<p>Watchdog Timer Error</p> <p>0: No Watchdog timer error has occurred since the last read of this register 1: A Watchdog timer error has occurred since the last read of this register</p> <p>Note: A reload operation when the Watchdog timer counter value is larger than WDTD causes a Watchdog timer error. Note that this bit is a write-one-clear flag.</p>
[0]	WDTUF	<p>Watchdog timer Underflow</p> <p>0: No Watchdog timer underflow has occurred since the last read of this register 1: A Watchdog timer underflow has occurred since the last read of this register</p> <p>Note that this bit is a write-one-clear flag.</p>

Watchdog Timer Protection Register – WDTPR

This register specifies the Watchdog timer protect key configuration.

Offset: 0x010

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24

Type/Reset	RW	0	RW	0	RW	0	RW	0	
	PROTECT								

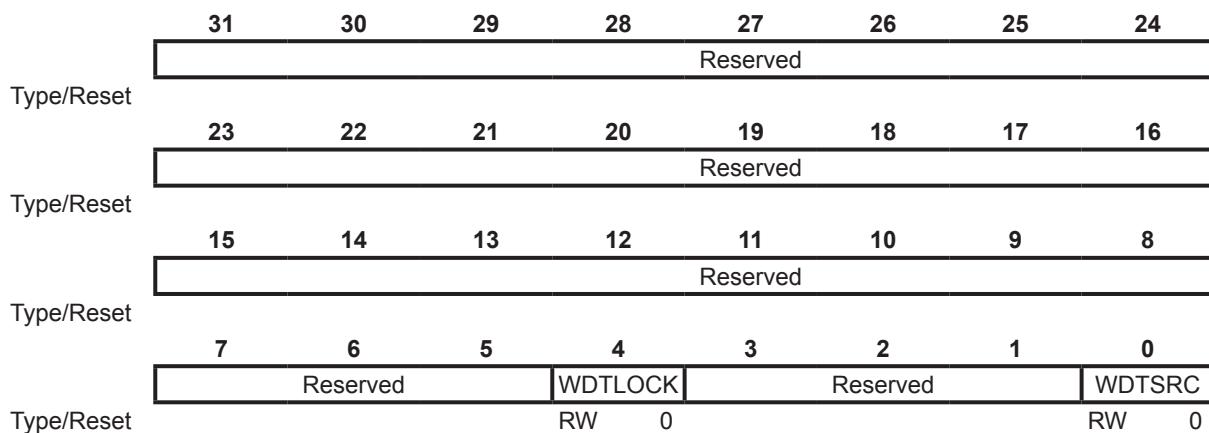

Bits	Field	Descriptions
[15:0]	PROTECT	<p>Watchdog Timer Register Protection</p> <p>For write operation:</p> <ul style="list-style-type: none"> 0x35CA: Disable the Watchdog timer register write protection Others: Enable the Watchdog timer register write protection <p>For read operation:</p> <ul style="list-style-type: none"> 0x0000: Watchdog timer register write protection is disabled 0x0001: Watchdog timer register write protection is enabled <p>This register is used to enable / disable the Watchdog timer configuration register write protection function. All configuration registers become read only except for WDTCR and WDTPR when the register write protection is enabled. Additionally, the read operation of PROTECT[0] can obtain the enable / disable status of the register write protection function.</p>

Watchdog Timer Clock Selection Register – WDTCSR

This register specifies the Watchdog timer clock source selection and lock configuration.

Offset: 0x018

Reset value: 0x0000_0000

Bits	Field	Descriptions
[4]	WDTLOCK	<p>Watchdog Timer Lock Mode</p> <p>0: This bit is only set to 0 on any reset. It cannot be cleared by software</p> <p>1: This bit is set once only by software and locks the Watchdog timer function</p> <p>Software can set this bit to 1 at any time. Once the WDTLOCK bit is set, the function and registers of the Watchdog timer cannot be modified or disabled, including the Watchdog timer clock source, and only waits for a system reset to disable the lock mode.</p>
[0]	WDTSRC	<p>Watchdog Timer Clock Source Selection</p> <p>0: Internal 32 kHz RC oscillator clock selected (LSI)</p> <p>1: External 32.768 kHz crystal oscillator clock selected (LSE)</p> <p>Select using software to control the Watchdog timer clock source.</p>

18 Inter-Integrated Circuit (I²C)

Introduction

The I²C Module is an internal circuit allowing communication with an external I²C interface which is an industry standard two-wire serial interface used for connection to external hardware. These two serial lines are known as a serial data line, SDA, and a serial clock line, SCL. The I²C module provides three data transfer rates: (1) 100 kHz in the Standard mode, (2) 400 kHz in the Fast mode and (3) 1 MHz in the Fast mode plus. The SCL period generation registers are used to setup different kinds of duty cycle implementation for the SCL pulse.

The SDA line which is connected to the whole I²C bus is a bidirectional data line between the master and slave devices used for the transmission and reception of data. The I²C module also has an arbitration detection function to prevent the situation where more than one master attempts to transmit data on the I²C bus at the same time.

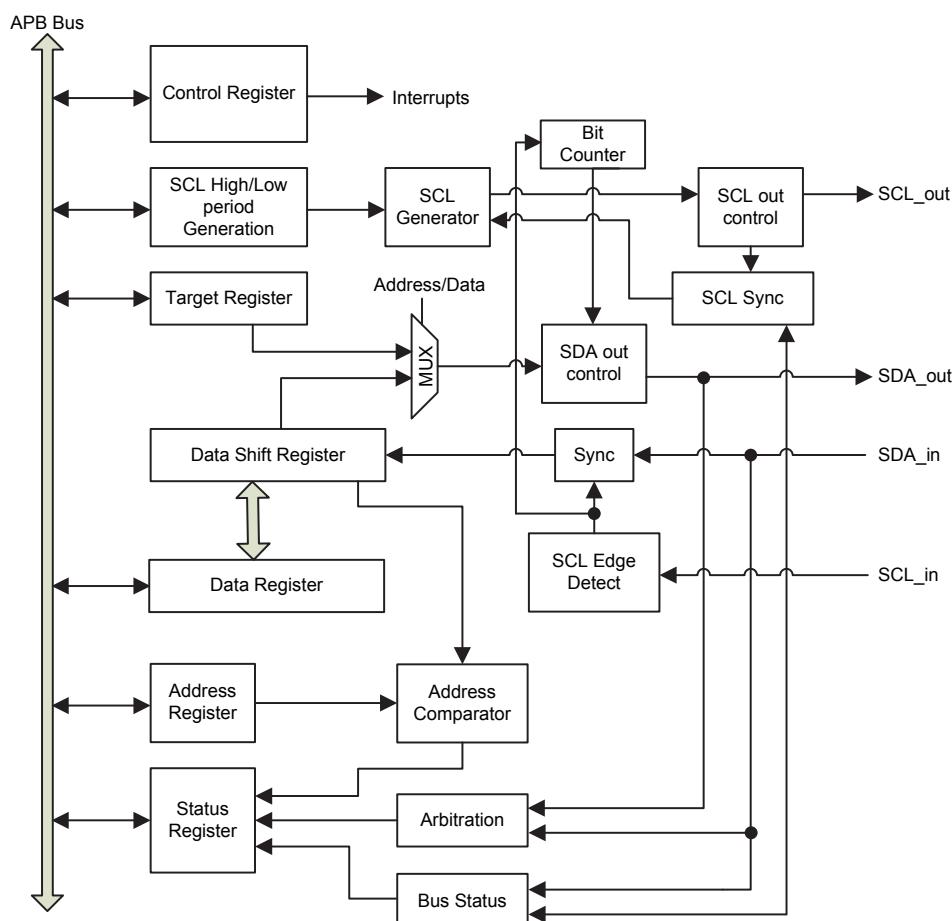

Figure 96. I²C Module Block Diagram

Features

- Two-wire I²C serial interface
 - Serial data line (SDA) and serial clock (SCL)
- Multiple speed modes
 - Standard mode – 100 kHz
 - Fast mode – 400 kHz
 - Fast mode plus – 1 MHz
- Bidirectional data transfer between master and slave
- Multi-master bus – no central master
 - The same interface can act as Master or Slave
- Arbitration among simultaneously transmitting masters without corrupting serial data on the bus
- Clock synchronization
 - Allow devices with different bit rates to communicate via one serial bus
- Supports 7-bit and 10-bit addressing mode and general call addressing.
- Multiple slave addresses using address mask function
- Timeout function

Functional Descriptions

Two-Wire Serial Interface

The I²C module has two external lines, the serial data SDA and serial clock SCL lines, to carry information between the interconnected devices connected to the bus. The SCL and SDA lines are both bidirectional and must be connected to a pull-high resistor. When the I²C bus is in the free or idle state, both pins are at a high level to perform the required wired-AND function for multiple connected devices.

START and STOP Conditions

A master device can initialize a transfer by sending a START signal and terminate the transfer with a STOP signal. A START signal is usually referred to as the “S” bit, which is defined as a High to Low transition on the SDA line while the SCL line is high. A STOP signal is usually referred to as the “P” bit, which is defined as a Low to High transition on the SDA line while SCL is high.

A repeated START signal, which is denoted as the “Sr” bit, is functionally identical to the normal START condition. A repeated START signal allows the I²C interface to communicate with another slave device or with the same device but in a different transfer direction without releasing the I²C bus control.

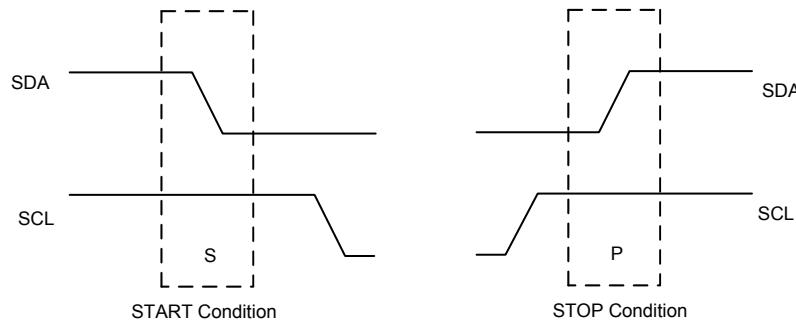

Figure 97. START and STOP Condition

Data Validity

The data on the SDA line must be stable during the high period of the SCL clock. The SDA data state can only be changed when the clock signal on the SCL line is in a low state.

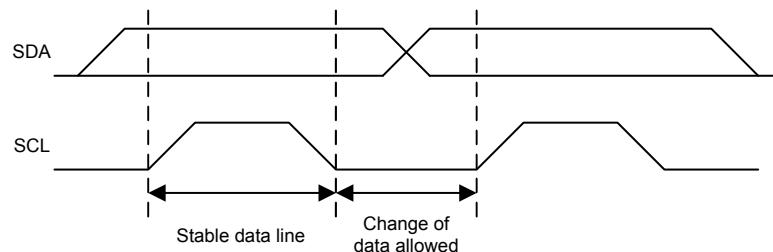

Figure 98. Data Validity

Addressing Format

The I²C interface starts to transfer data after the master device has sent the address to confirm the targeted slave device. The address frame is sent just after the START signal by the master device. The addressing mode selection bit named ADRM in the I2CCR register should be defined to choose either the 7-bit or 10-bit addressing mode.

7-bit Address Format

The 7-bit address format is composed of the 7-bit length slave address, which the master device wants to communicate, with a R/W bit and an ACK bit. The R/W bit defines the direction of the data transfer.

R/W = 0 (Write): The master transmits data to the addressed slave.

R/W = 1 (Read): The master receives data from the addressed slave.

The slave address can be assigned through the ADDR field in the I2CADDR register. The slave device sends back the acknowledge bit (ACK) if its slave address matches the transmitted address sent by master.

Note that it is forbidden to own the same address for two slave devices.

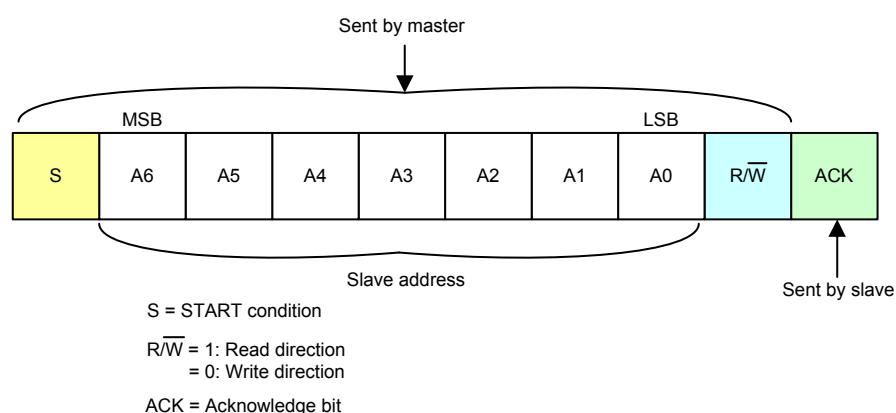

Figure 99. 7-bit Addressing Mode

10-bit Address Format

In order to prevent address clashes, due to the limited range of the 7-bit addresses, a new 10-bit address scheme has been introduced. This enhancement can be mixed with the 7-bit addressing mode which increases the available address range about ten times. For the 10-bit addressing mode, the first two bytes after a START signal include a header byte and an address byte that usually determines which slave will be selected by the master. The header byte is composed of a leading “11110”, the 10th and 9th bits of the slave address. The second byte is the remaining 8 bits of the slave device address.

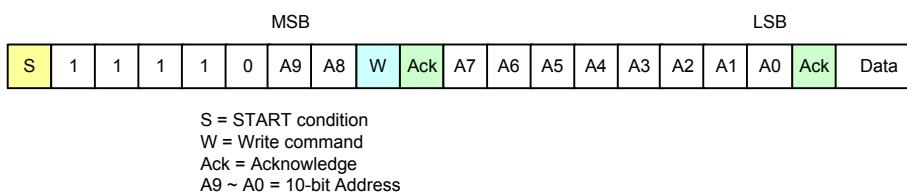

Figure 100. 10-bit Addressing Write Transmit Mode

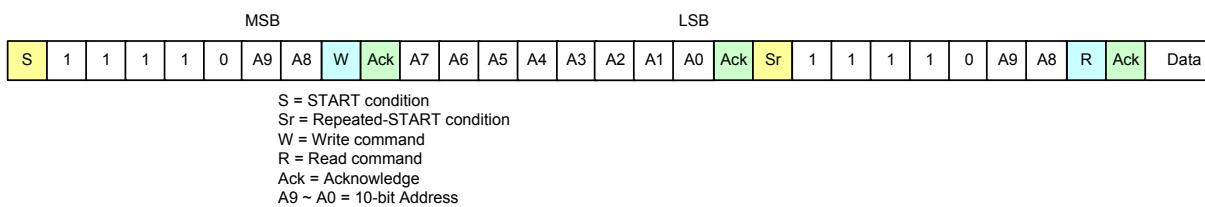

Figure 101. 10-bits Addressing Read Receive Mode

Data Transfer and Acknowledge

Once the slave device address has been matched, the data can be transmitted to or received from the slave device according to the transfer direction specified by the R/W bit. Each byte is followed by an acknowledge bit on the 9th SCL clock.

If the slave device returns a Not Acknowledge (NACK) signal to the master device, the master device can generate a STOP signal to terminate the data transfer or generate a repeated START signal to restart the transfer.

If the master device sends a Not Acknowledge (NACK) signal to the slave device, the slave device should release the SDA line for the master device to generate a STOP signal to terminate the transfer.

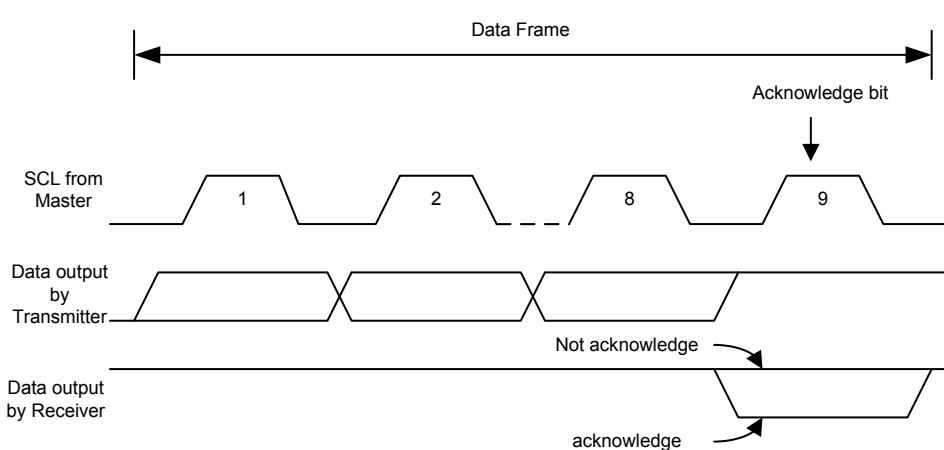

Figure 102. I²C Bus Acknowledge

Clock Synchronization

Only one master device can generate the SCL clock under normal operation. However when there is more than one master trying to generate the SCL clock, the clock should be synchronized so that the data output can be compared. Clock synchronization is performed using the wired-AND connection of the I²C interface to the SCL line.

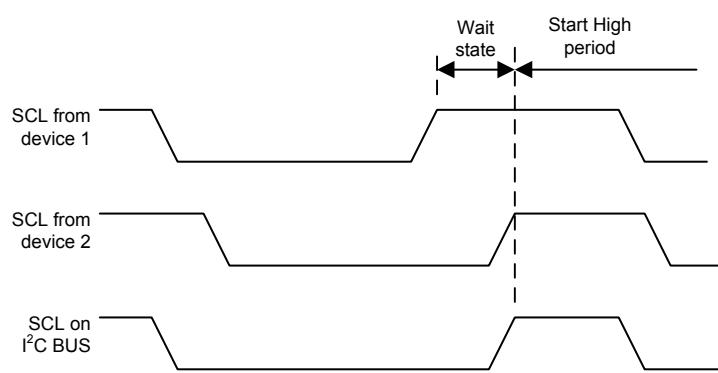

Figure 103. Clock Synchronization during Arbitration

Arbitration

A master may start a transfer only if the I²C bus line is in the free or idle mode. If two or more masters generate a START signal at approximately the same time, an arbitration procedure will occur.

Arbitration takes place on the SDA line and can continue for many bits. The arbitration procedure gives a higher priority to the device that transmits serial data with a binary low bit (logic low). Other master devices which want to transmit binary high bits (logic high) will lose the arbitration. As soon as a master loses the arbitration, the I²C module will set the ARBLOS bit in the I2CSR register and generate an interrupt if the interrupt enable bit, ARBLOSIE, in the I2CIER register is set to 1. Meanwhile, it stops sending data and listens to the bus in order to detect an I²C stop signal. When the stop signal is detected, the master which has lost the arbitration may try to access the bus again.

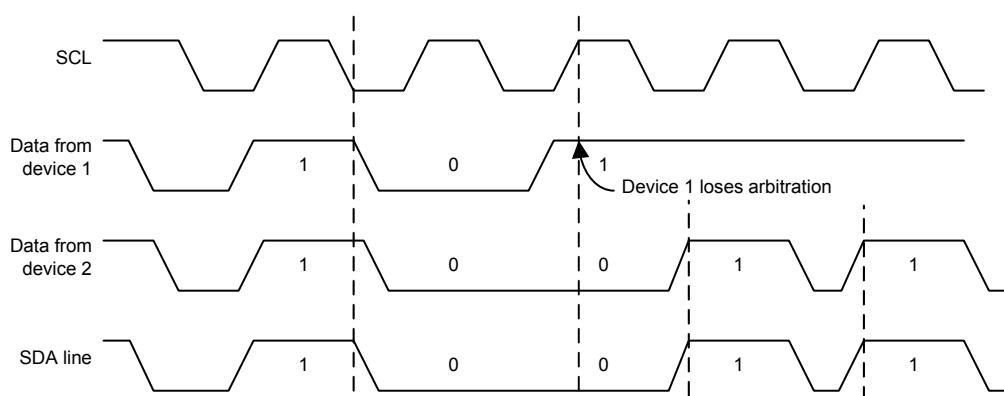

Figure 104. Two Master Arbitration Procedure

General Call Addressing

The general call addressing function can be used to address all the devices connected to the I²C bus. The master device can activate the general call function by writing a value “00” into the TAR field and setting the RWD bit to 0 in the I2CTAR register on the addressing frame.

The device can support the general call addressing function by setting the corresponding enable control bit GCEN to 1. If the GCEN bit is set to 1 to support the general call addressing, the AA bit in the I2CCR register should also be set to 1 to send an acknowledge signal back when the device receives an address frame with a value of 00H. When this condition occurs, the general call flag, GCS, will be set to 1, but the ADRS flag will not be set.

Bus Error

If an unpredictable START or STOP condition occurs when the data is being transferred on the I²C bus, it will be considered as a bus error and the transferring data will be aborted. When a bus error event occurs, the relevant bus error flag BUSERR in the I2CSR register will set to 1 and both the SDA and SCL lines are released. The BUSERR flag should be cleared by writing a 1 to it to initiate the I²C module to an idle state.

Address Mask Enable

The I²C module provides an address mask function for users to decide which address bit can be ignored during the comparison with the address frame sent from the master. The ADRS flag will be asserted when the unmasked address bits and the address frame sent from the master are matched. Note that this function is only available in the slave mode.

For instance, the user sets a data transfer with the 7-bit addressing mode together with the I2CADDMR register value as 0x05h and the I2CADDR register value as 0x55h, this means if an address which is sent by an I²C master on the bus is equal to 0x50h, 0x51h, 0x54h or 0x55h, the I²C slave address will all be considered to be matched and the ADRS flag in the I2CSR register will be asserted after the address frame.

Address Snoop

The Address Snoop register, I2CADDSSR, is used to monitor the calling address on the I²C bus during the whole data transfer operation no matter if the I²C module operates as a master or a slave device. Note that the I2CADDSSR register is a read only register and each calling address on the I²C bus will be stored in the I2CADDSSR register automatically even if the I²C device is not addressed.

Operation Mode

The I²C module can operate in the following modes:

- Master Transmitter
- Master Receiver
- Slave Transmitter
- Slave Receiver

The I²C module operates in the slave mode by default. The interface will switch to the master mode automatically after generating a START signal.

Master Transmitter Mode

Start Condition

Users write the target slave device address and communication direction into the I2CTAR register after setting the I2CEN bit in the I2CCR register. The STA flag in the I2CSR register is set by hardware after a start condition occurs. In order to send the following address frame, the STA flag must be cleared to 0 if it has been set to 1. The STA flag is cleared by reading the I2CSR register.

Address Frame

The ADRS flag in the I2CSR register will be set after the address frame is sent by the master device and the acknowledge signal from the address matched slave device is received. In order to send the following data frame, the ADRS flag must be cleared to 0 if it has been set to 1. The ADRS bit is cleared by reading the I2CSR register.

Data Frame

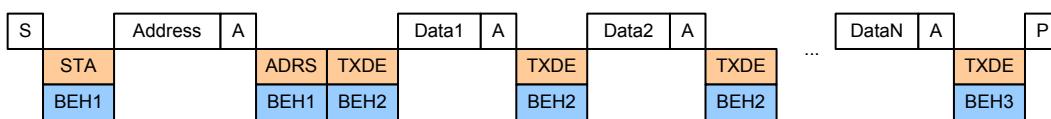

The data to be transmitted to the slave device must be transferred to the I2CDR register.

The TXDE bit in the I2CSR register is set to indicate that the I2CDR register is empty, which results in the SCL line being held at a logic low state. New data must then be transferred to the I2CDR register to continue the data transfer process. Writing a data into the I2CDR register will clear the TXDE flag.

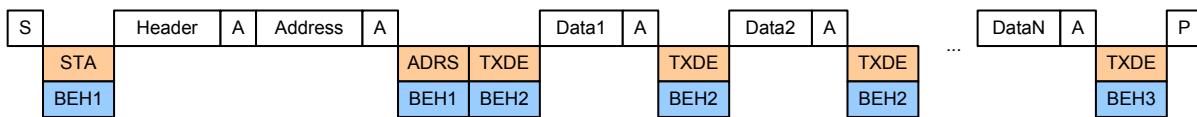

Close / Continue Transmission

After transmitting the last data byte, the STOP bit in the I2CCR register can be set to terminate the transmission or re-assign another slave device by configuring the I2CTAR register to restart a new transfer.

7-bit Master Transmitter

10-bit Master Transmitter

BEH1 : cleared by reading I2CSR register

BEH2 : cleared by writing I2CDR register

BEH3 : cleared by HW automatically by sending STOP condition

Figure 105. Master Transmitter Timing Diagram

Master Receiver Mode

Start Condition

The target slave device address and communication direction must be written into the I2CTAR register. The STA flag in the I2CSR register is set by hardware after a start condition occurs. In order to send the following address frame, the STA flag must be cleared to 0 if it has been set to 1. The STA flag is cleared by reading the I2CSR register.

Address Frame

In the 7-bit addressing mode: The ADRS flag is set after the address frame is sent by the master device and the acknowledge signal from the address matched slave device is received. In order to receive the following data frame, the ADRS bit must be cleared to 0 if it has been set to 1. The ADRS bit is cleared after reading the I2CSR register.

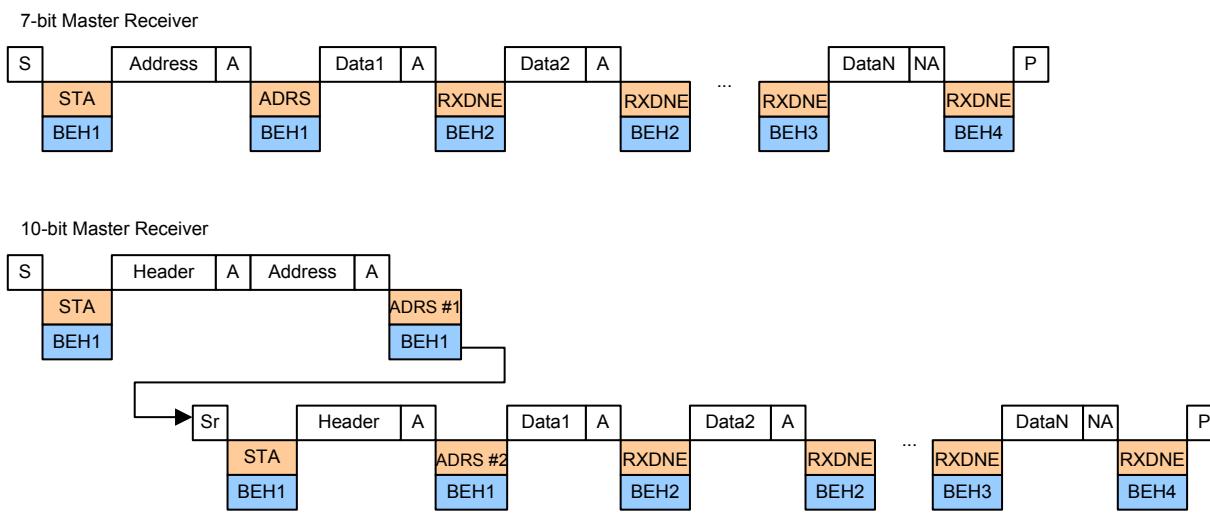

In the 10-bit addressing mode: The ADRS bit in the I2CSR register will be set twice in the 10-bit addressing mode. The first time the ADRS bit is set is when the 10-bit address is sent and the acknowledge signal from the slave device is received. The second time the ADRS bit is set is when the header byte is sent and the slave acknowledge signal is received. In order to receive the following data frame, the ADRS bit must be cleared to 0 if it has been set to 1. The ADRS bit is cleared after reading the I2CSR register. The detailed master receiver mode timing diagram is shown in the following figure.

Data Frame

In the master receiver mode, data is transmitted from the slave device. Once a data is received by the master device, the RXDNE flag in the I2CSR register is set but it will not hold the SCL line. However, if the device receives a complete new data byte and the RXDNE flag has already been set to 1, the RXBF bit in the I2CSR register will be set to 1 and the SCL line will be held at a logic low state. When this situation occurs, data from the I2CDR register should be read to continue the data transfer process. The RXDNE flag can be cleared after reading the I2CDR register.

Close / Continue Transmission

The master device needs to reset the AA bit in the I2CCR register to send a NACK signal to the slave device before the last data byte transfer has been completed. After the last data byte has been received from the slave device, the master device will hold the SCL line at a logic low state following after a NACK signal sent by the master device to the slave device. The STOP bit can be set to terminate the data transfer process or re-assign the I2CTAR register to restart a new transfer.

BEH1 : cleared by reading I2CSR register

BEH2 : cleared by reading I2CDR register

BEH3 : cleared by reading I2CDR register, set AA=0 to send NACK signal

BEH4 : cleared by reading I2CDR register, set STOP=1 to send STOP signal

Figure 106. Master Receiver Timing Diagram

Slave Transmitter Mode

Address Frame

In the 7-bit addressing mode, the ADRS bit in the I2CSR register is set after the slave device receives the calling address which matches with the slave device address. In the 10-bit addressing mode, the ADRS bit is set for the first time when the first header byte and the second address byte are both matched. Note that when the second header byte is also matched, the ADRS bit will be set again. After the ADRS bit has been set to 1, it must be cleared to 0 to continue the data transfer process. The ADRS bit is cleared after reading the I2CSR register.

Data Frame

In the Slave transmitter mode, the TXDE bit is set to indicate that the I2CDR is empty, which results in the SCL line being held at a logic low state. New transmission data must then be written into the I2CDR register to continue the data transfer process. Writing a data into the I2CDR register will clear the TXDE bit.

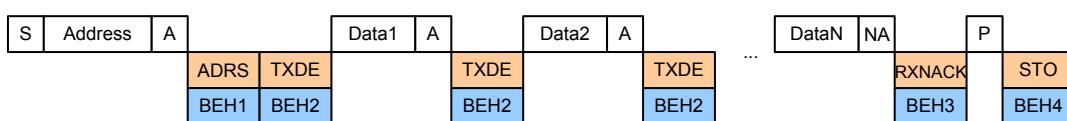

Receive Not-Acknowledge

When the slave device receives a Not-Acknowledge signal, the RXNACK bit in the I2CSR Register is set but it will not hold the SCL line. Writing "1" to RXNACK will clear the RXNACK flag.

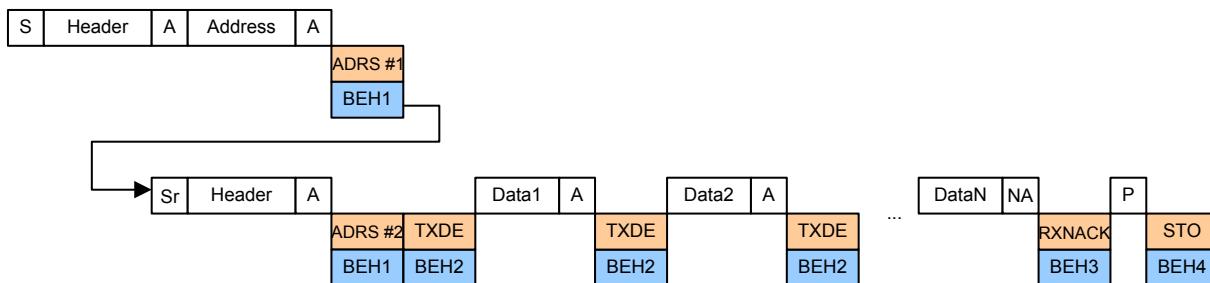

STOP Condition

When the slave device detects a STOP condition, the STO bit in the I2CSR register is set to indicate that the I²C interface transmission is terminated. Reading the I2CSR register can clear the STO flag.

7-bit Slave Transmitter

10-bit Slave Transmitter

BEH1 : cleared by reading I2CSR register

BEH2 : cleared by writing I2CDR register

BEH3 : cleared by writing 1 clear for RXNACK flag, TXDE is not set when NACK is received.

BEH4 : cleared by reading I2CSR register

Figure 107. Slave Transmitter Timing Diagram

Slave Receiver Mode

Address Frame

The ADRS bit in the I2CSR register is set after the slave device receives the calling address which matches with the slave device address. After the ADRS bit has been set to 1, it must be cleared to 0 to continue the data transfer process. The ADRS flag is cleared after reading the I2CSR register.

Data Frame

In the slave receiver mode, the data is transmitted from the master device. Once a data byte is received by the slave device, the RXDNE flag in the I2CSR register is set but it will not hold the SCL line. However, if the device receives a complete new data byte and the RXDNE bit has been set to 1, the RXBF bit in the I2CSR register will be set to 1 and the SCL line will be held at a logic low state. When this situation occurs, data from the I2CDR register should be read to continue the data transfer process. The RXDNE flag bit can be cleared after reading the I2CDR register.

STOP Condition

When the slave device detects a STOP condition, the STO flag bit in the I2CSR register is set to indicate that the I²C interface transmission is terminated. Reading the I2CSR register can clear the STO flag bit.

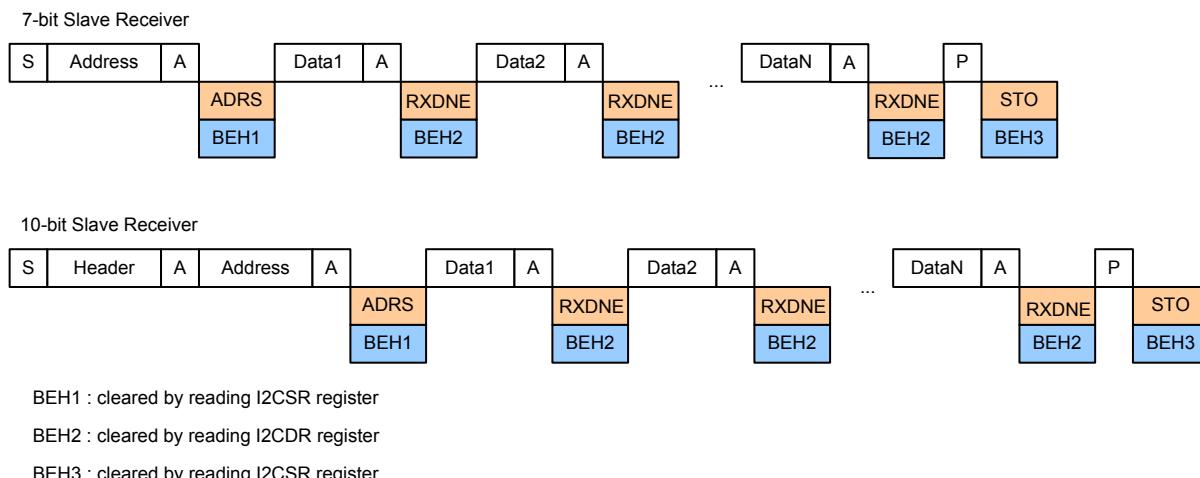

Figure 108. Slave Receiver Timing Diagram

Conditions of Holding SCL Line

The following conditions will cause the SCL line to be held at a logic low state by hardware resulting in all the I²C transfers being stopped. Data transfer will be continued after the creating conditions are eliminated.

Table 38. Conditions of Holding SCL line

Type	Condition	Description	Eliminated
Flag	TXDE	I ² C is used in transmitted mode and I2CDR register needs to have data to transmit. (Note: TXDE won't be assert after receiving a NACK)	Master case: Writing data to I2CDR register Set TAR Set STOP Slave case: Writing data to I2CDR register
	GCS	I ² C is addressed as slave through general call	Reading I2CSR register
	ADRS	Master: I ² C is sent over address frame and is returned an ACK from slave (Note: Reference Fig.105 and Fig.106) Slave: I ² C is addressed as slave device (Note: Reference Fig.107 and Fig.108)	Reading I2CSR register
	STA	Master sends a START signal	Reading I2CSR register
	RXBF	Received a complete new data and meanwhile the RXDNE flag has been set already before.	Reading I2CDR register
Event	Master receives NACK	No matter in address or data frame, once received a NACK signal will hold SCL line in master mode.	Set TAR Set STOP
	Master sends NACK used in receive mode	Occurred when receiving the last data byte in Master receive mode (Note: Reference Fig.106, and RXNACK flag won't be asserted in this case)	Set TAR Set STOP

I²C Timeout Function

In order to reduce the occurrence of I²C lockup problem due to the reception of erroneous clock source, a timeout function is provided. If the I²C bus clock source is not received for a certain timeout period, then a corresponding I²C timeout flag will be asserted. This timeout period is determined by a 16-bit down-counting counter with a programmable preload value. The timeout counter is driven by the I²C timeout clock, f_{I²CTO}, which is specified by the timeout prescaler field in the I2CTOUT register. The TOUT field in the I2CTOUT register is used to define the timeout counter preload value. The timeout function is enabled by setting the ENTOUT bit in the I2CCR register. The timeout counter will start to count down from the preloaded value if the ENTOUT bit is set to 1 and one of the following conditions occurs:

- The I²C master module sends a START signal.
- The I²C slave module detects a START signal.
- The RXBF, TXDE, RXDNE, RXNACK, GCS or ADRS flags is asserted.

The timeout counter will stop counting when the ENTOUT bit is cleared. However, the counter will also stop counting when one of the conditions, listed as follows, occurs:

- The I²C slave module is not addressed.
- The I²C slave module detects a STOP signal.
- The I²C master module sends a STOP signal.
- The ARBLOS or BUSERR flag in the I2CSR register are asserted.

If the timeout counter underflows, the corresponding timeout flag, TOUTF, in the I2CSR register will be set to 1 and a timeout interrupt will be generated if the relevant interrupt is enabled.

Register Map

The following table shows the I²C registers and reset values.

Table 39. I²C Register Map

Register	Offset	Description	Reset Value
I2CCR	0x000	I ² C Control Register	0x0000_2000
I2CIER	0x004	I ² C Interrupt Enable Register	0x0000_0000

Register Descriptions

I²C Control Register – I2CCR

This register specifies the corresponding I²C function enable control.

Offset: 0x000 (0)

Reset value: 0x0000_2000

Bits	Field	Descriptions
[15:14]	SEQFILTER	SDA or SCL Input Sequential Filter Configuration Bits 00: Sequential filter is disabled 01: 1 PCLK glitch filter 1x: 2 PCLK glitch filter Note: This setting would affect the frequency of SCL. Detail is described in I2CSLPGR register.
[13]	COMBFILTEREN	SDA or SCL Input Combinational Filter Enable Bit 0: Combinational filter is disabled 1: Combinational filter is enabled
[12]	ENTOUT	I ² C Timeout Function Enable Control 0: Timeout Function is disabled 1: Timeout Function is enabled This bit is used to enable or disable the I ² C timeout function. When the I2CEN bit is cleared to 0, the ENTOUT bit will be automatically cleared to 0 by hardware. It is recommended that users have to properly configure the PSC and TOUT fields in the I2CTOUT register before the timeout counter starts to count by setting the ENTOUT bit to 1.
[7]	ADRM	Addressing Mode 0: 7-bit addressing mode 1: 10-bit addressing mode When the I ² C master / slave module operates in the 7-bit addressing mode, it can only send out and respond to a 7-bit address and vice versa. When the I2CEN bit is disabled, the ADRM bit is automatically cleared to 0 by hardware.
[3]	I2CEN	I ² C Interface Enable 0: I ² C interface is disabled 1: I ² C interface is enabled

Bits	Field	Descriptions
[2]	GCEN	<p>General Call Enable</p> <p>0: General call is disabled 1: General call is enabled</p> <p>When the device receives the calling address with a value of 0x00 and if both the GCEN and the AA bits are set to 1, then the I²C interface is addressed as a slave and the GCS bit in the I2CSR register is set to 1. When the I2CEN bit is cleared to 0, the GCEN bit is automatically cleared to 0 by hardware.</p>
[1]	STOP	<p>STOP Condition Control</p> <p>0: No action 1: Send a STOP condition in master mode</p> <p>This bit is set to 1 by software to generate a STOP condition and automatically cleared to 0 by hardware. The STOP bit is only available for the master device.</p>
[0]	AA	<p>Acknowledge Bit</p> <p>0: Send a Not Acknowledge (NACK) signal after a byte is received 1: Send an Acknowledge (ACK) signal after a byte is received</p> <p>When the I2CEN bit is cleared to 0, the AA bit is automatically cleared to 0 by hardware.</p>

I²C Interrupt Enable Register – I2CIER

This register specifies the corresponding I²C interrupt enable bits.

Offset: 0x004

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24

Bits	Field	Descriptions
[18]	RXBFI	RX Buffer Full Interrupt Enable Bit 0: Interrupt is disabled 1: Interrupt is enabled When the I2CEN bit in the I2CCR register is cleared to 0, this bit is cleared to 0 by hardware.
[17]	TXDEIE	Data Register Empty Interrupt Enable Bit in Transmitter Mode 0: Interrupt is disabled 1: Interrupt is enabled When the I2CEN bit in the I2CCR register is cleared to 0, this bit is cleared to 0 by hardware.
[16]	RXDNEIE	Data Register Not Empty Interrupt Enable Bit in Received Mode 0: Interrupt is disabled 1: Interrupt is enabled When the I2CEN bit in the I2CCR register is cleared to 0, this bit is cleared to 0 by hardware.
[11]	TOUTIE	Timeout Interrupt Enable Bit 0: Interrupt is disabled 1: Interrupt is enabled When the I2CEN bit in the I2CCR register is cleared to 0, this bit is cleared to 0 by hardware.
[10]	BUSERRIE	Bus Error Interrupt Enable Bit 0: Interrupt is disabled 1: Interrupt is enabled When the I2CEN bit in the I2CCR register is cleared to 0, this bit is cleared to 0 by hardware.
[9]	RXNACKIE	Received Not Acknowledge Interrupt Enable Bit 0: Interrupt is disabled 1: Interrupt is enabled When the I2CEN bit in the I2CCR register is cleared to 0, this bit is cleared to 0 by hardware.

Bits	Field	Descriptions
[8]	ARBLOSIE	Arbitration Loss Interrupt Enable Bit in the I ² C multi-master mode 0: Interrupt is disabled 1: Interrupt is enabled When the I2CEN bit in the I2CCR register is cleared to 0, this bit is cleared to 0 by hardware.
[3]	GCSIE	General Call Slave Interrupt Enable Bit 0: Interrupt is disabled 1: Interrupt is enabled When the I2CEN bit in the I2CCR register is cleared to 0, this bit is cleared to 0 by hardware.
[2]	ADRSIE	Slave Address Match Interrupt Enable Bit 0: Interrupt is disabled 1: Interrupt is enabled When the I2CEN bit in the I2CCR register is cleared to 0, this bit is cleared to 0 by hardware.
[1]	STOIE	STOP Condition Detected Interrupt Enable Bit 0: Interrupt is disabled 1: Interrupt is enabled When the I2CEN bit in the I2CCR register is cleared to 0, this bit is cleared to 0 by hardware. The bit is used for the I ² C slave mode only.
[0]	STAIE	START Condition Transmit Interrupt Enable Bit 0: Interrupt is disabled 1: Interrupt is enabled When the I2CEN bit in the I2CCR register is cleared to 0, this bit is cleared to 0 by hardware. The bit is used for the I ² C master mode only.

I²C Address Register – I2CADDR

This register specifies the I²C device address.

Offset: 0x008

Reset value: 0x0000_0000

Bits	Field	Descriptions
[9:0]	ADDR	Device Address The register indicates the I ² C device address. When the I ² C device is used in the 7-bit addressing mode, only the ADDR[6:0] bits will be compared with the received address sent from the I ² C master device.

I²C Status Register – I2CSR

This register contains the I²C operation status.

Offset: 0x00C

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24

Bits	Field	Descriptions
[21]	TXNRX	Transmitter / Receiver Mode 0: Receiver mode 1: Transmitter mode Read only bit.
[20]	MASTER	Master Mode 0: I ² C is in the slave mode or idle 1: I ² C is in the master mode The I ² C interface is switched as a master device on the I ² C bus when the I2CTAR register is assigned and the I ² C bus is idle. The MASTER bit is cleared by hardware when software disables the I ² C bus by clearing the I2CEN bit to 0 or sends a STOP condition to the I ² C bus or the bus error is detected. This bit is set and cleared by hardware and is a read only bit.
[19]	BUSBUSY	Bus Busy 0: I ² C bus is idle 1: I ² C bus is busy The I ² C interface hardware starts to detect the I ² C bus status if the interface is enabled by setting the I2CEN bit to 1. It is set to 1 when the SDA or SCL signal is detected to have a logic low state and cleared when a STOP condition is detected.
[18]	RXBF	Buffer Full Flag in Receiver Mode 0: Data buffer is not full 1: Data buffer is full This bit is set when the data register I2CDR has already stored a data byte and meanwhile the data shift register also has been received a complete new data byte. The RXBF bit is cleared by software reading the I2CDR register.

Bits	Field	Descriptions
[17]	TXDE	<p>Data Register Empty Using in Transmitter Mode</p> <p>0: Data register I2CDR is not empty 1: Data register I2CDR is empty</p> <p>This bit is set when the I2CDR register is empty in the Transmitter mode. Note that the TXDE bit will be set after the address frame is being transmitted to inform that the data to be transmitted should be loaded into the I2CDR register. The TXDE bit is cleared by software writing data to the I2CDR register in both the master and slave mode or cleared automatically by hardware after setting the STOP signal to terminate the data transfer or setting the I2CTAR register to restart a new data transfer in the master mode.</p>
[16]	RXDNE	<p>Data Register Not Empty in Receiver Mode</p> <p>0: Data register I2CDR is empty 1: Data register I2CDR is not empty</p> <p>This bit is set when the I2CDR register is not empty in the receiver mode. The RXDNE bit is cleared by software reading the data byte from the I2CDR register.</p>
[11]	TOUTF	<p>Timeout Counter Underflow Flag</p> <p>0: No timeout counter underflow occurred 1: Timeout counter underflow occurred</p> <p>Writing “1” to this bit will clear the TOUTF flag.</p>
[10]	BUSERR	<p>Bus Error Flag</p> <p>0: No bus error has occurred 1: Bus error has occurred</p> <p>This bit is set by hardware when the I²C interface detects a misplaced START or STOP condition in a transfer process. Writing a “1” to this bit will clear the BUSERR flag.</p> <p>In Master Mode: Once the Bus Error event occurs, both the SDA and SCL lines are released by hardware and the BUSERR flag is asserted. The application software has to clear the BUSERR flag before the next address byte is transmitted.</p> <p>In Slave Mode: Once a misplaced START or STOP condition has been detected by the slave device, the software must clear the BUSERR flag before the next address byte is received.</p>
[9]	RXNACK	<p>Received Not Acknowledge Flag</p> <p>0: Acknowledge is returned from receiver 1: Not Acknowledge is returned from receiver</p> <p>The RXNACK bit indicates that the not Acknowledge signal is received in master or slave transmitter mode. Writing “1” to this bit will clear the RXNACK flag.</p>
[8]	ARBLOS	<p>Arbitration Loss Flag</p> <p>0: No arbitration loss is detected 1: Bit arbitration loss is detected</p> <p>This bit is set by hardware on the current clock which the I²C interface loses the bus arbitration to another master during the address or data frame transmission. Writing “1” to this bit will clear the ARBLOS flag. Once the ARBLOS flag is asserted by hardware, the ARBLOS flag must be cleared before the next transmission.</p>
[3]	GCS	<p>General Call Slave Flag</p> <p>0: No general call slave occurs 1: I²C interface is addressed by a general call command</p> <p>When the I²C interface receives an address with a value of 0x00 or 0x000 in the 7-bit or 10-bit addressing mode, if both the GCEN and the AA bit are set to 1, then it is switched as a general call slave. This flag is cleared automatically after being read.</p>

Bits	Field	Descriptions
[2]	ADRS	<p>Address Transmit (master mode) / Address Receive (slave mode) Flag</p> <p>Address Sent in Master Mode</p> <ul style="list-style-type: none"> 0: Address frame has not been transmitted 1: Address frame has been transmitted <p>For the 7-bit addressing mode, this bit is set after the master device receives the address frame acknowledge bit sent from the slave device. For the 10-bit addressing mode, this bit is set after receiving the acknowledge bits of the first header byte and the second address.</p> <p>Address Matched in Slave Mode</p> <ul style="list-style-type: none"> 0: I²C interface is not addressed 1: I²C interface is addressed as slave <p>When the I²C interface has received the calling address that matches the address defined in the I2CADDR register together with the AA bit being set to 1 in the I2CCR register, it will be switched to a slave mode. This flag is cleared automatically after the I2CSR register has been read.</p>
[1]	STO	<p>STOP Condition Detected Flag</p> <ul style="list-style-type: none"> 0: No STOP condition detected 1: STOP condition detected in slave mode <p>This bit is only available for the slave mode and is cleared automatically after the I2CSR register is read.</p>

100 kHz (Standard Mode)	88	188
400 kHz (Fast Mode)	13	38
1 MHz (Fast Mode Plus)	N/A	8

I²C Data Register – I2CDR

This register specifies the data to be transmitted or received by the I²C module.

Offset: 0x018

Reset value: 0x0000_0000

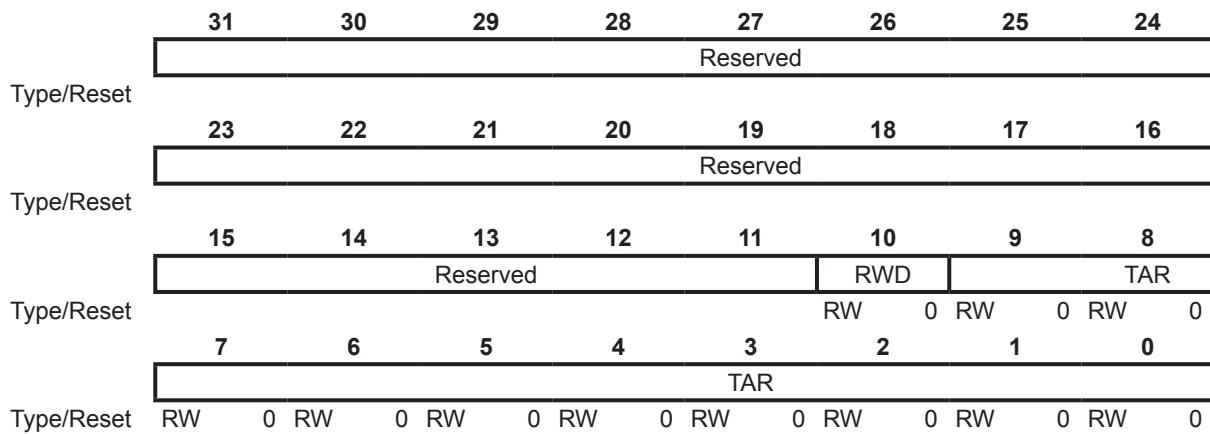

Bits	Field	Descriptions
[7:0]	DATA	<p>I²C Data Register</p> <p>For the transmitter mode, a data byte which is transmitted to a slave device can be assigned to these bits. The TXDE flag is cleared if the application software assigns new data to the I2CDR register. For the receiver mode, a data byte is received bit by bit from MSB to LSB through the I²C interface and stored in the data shift register. Once the acknowledge bit is given, the data shift register value is delivered into the I2CDR register if the RXDNE flag is equal to 0.</p>

I²C Target Register – I2CTAR

This register specifies the target device address to be communicated.

Offset: 0x01C

Reset value: 0x0000_0000

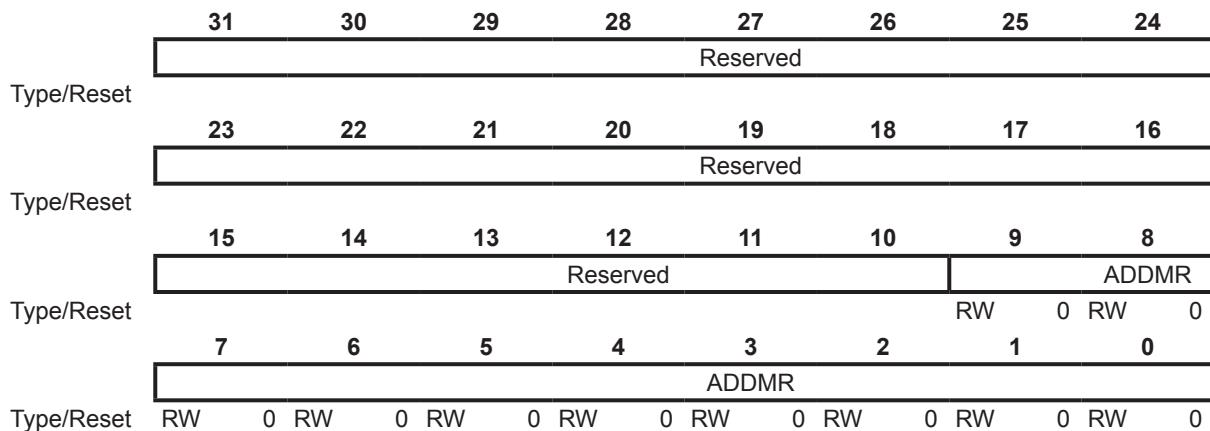

Bits	Field	Descriptions
[10]	RWD	Read or Write Direction 0: Write direction to target slave address 1: Read direction from target slave address If this bit is set to 1 in the 10-bit master receiver mode, the I ² C interface will initiate a byte with a value of 11110XX0b in the first header frame and then continue to deliver a byte with a value of 11110XX1b in the second header frame by hardware automatically.
[9:0]	TAR	Target Slave Address The I ² C interface will assign a START signal and send a target slave address automatically once the data is written to this register. When the system wants to send a repeated START signal to the I ² C bus, the timing is suggested to set the I2CTAR register after a byte transfer is completed. It is not allowed to set TAR in the address frame. I2CTAR[9:7] is not available under the 7-bit addressing mode.

I²C Address Mask Register – I2CADDMR

This register specifies which bit of the I²C address is masked and not compared with corresponding bit of the received address frame.

Offset: 0x020

Reset value: 0x0000_0000

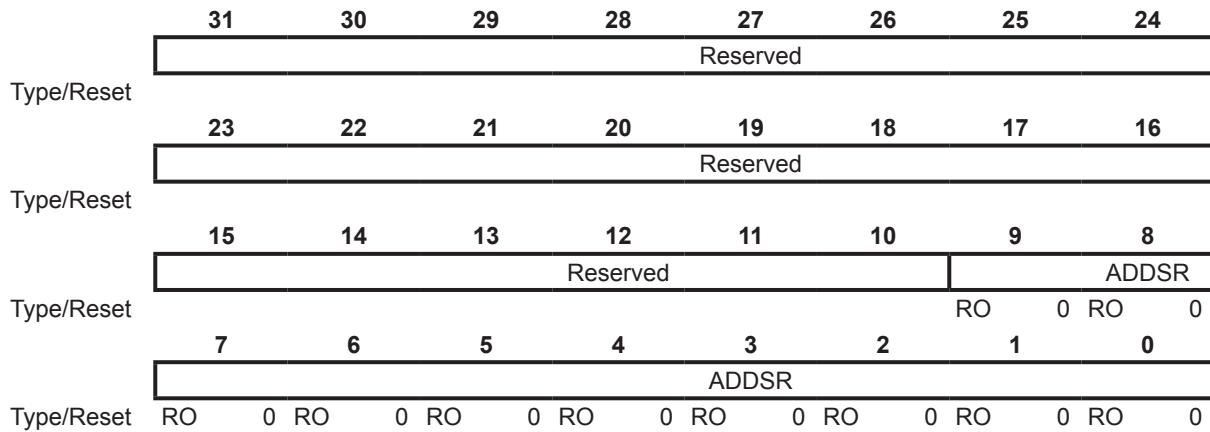

Bits	Field	Descriptions
[9:0]	ADDMR	<p>Address Mask Control Bit</p> <p>The ADDMR[i] is used to specify whether the ith bit of the ADDR in the I2CADDR register is masked and is compared with the received address frame or not on the I²C bus. The register is only used for the I²C slave mode only.</p> <p>0: ith bit of the ADDR is compared with the address frame on the I²C bus</p> <p>1: ith bit of the ADDR is masked and not compared with the address frame on the I²C bus</p>

I²C Address Snoop Register – I2CADDSSR

This register is used to indicate the address frame value appeared on the I²C bus.

Offset: 0x024

Reset value: 0x0000_0000

Bits	Field	Descriptions
[9:0]	ADDSR	Address Snoop Once the I2CEN bit is enabled, the calling address value on the I ² C bus will automatically be loaded into this ADDSR field.

I²C Timeout Register – I2CTOUT

This register specifies the I²C Timeout counter preload value and clock prescaler ratio.

Offset: 0x028

Reset value: 0x0000_0000

[15:0]	TOUT	<p>I²C Timeout Counter Preload Value</p> <p>The TOUT field is used to define the counter preloaded value</p> <p>The counter value is reloaded when any of the following conditions occurs:</p> <ol style="list-style-type: none"> 1. The RXBF, TXDE, RXDNE, RXNACK, GCS or ADRS flag in the I2CSR register is asserted. 2. The I²C master module sends a START signal. 3. The I²C slave module detects a START signal. <p>The counter stops counting when any of the following conditions occurs:</p> <ol style="list-style-type: none"> 1. The I²C slave device is not addressed. 2. The I²C master module sends a STOP signal. 3. The I²C slave module detects a STOP signal. 4. The ARBLOS or BUSERR flag in the I2CSR register is asserted.

19 Serial Peripheral Interface (SPI)

Introduction

The Serial Peripheral Interface, SPI, provides an SPI protocol data transmit and receive functions in both master or slave mode. The SPI interface uses 4 pins, among which are serial data input and output lines MISO and MOSI, the clock line SCK, and the slave select line SEL. One SPI device acts as a master who controls the data flow using the SEL and SCK signals to indicate the start of the data communication and the data sampling rate. To receive the data bits, the streamlined data bits which range from 1 bit to 16 bits specified by the DFL field in the SPICR1 register are latched on a specific clock edge and stored in the data register or in the RX FIFO. Data transmission is carried in a similar way but with the reverse sequence. The mode fault detection provides a capability for multi-master applications.

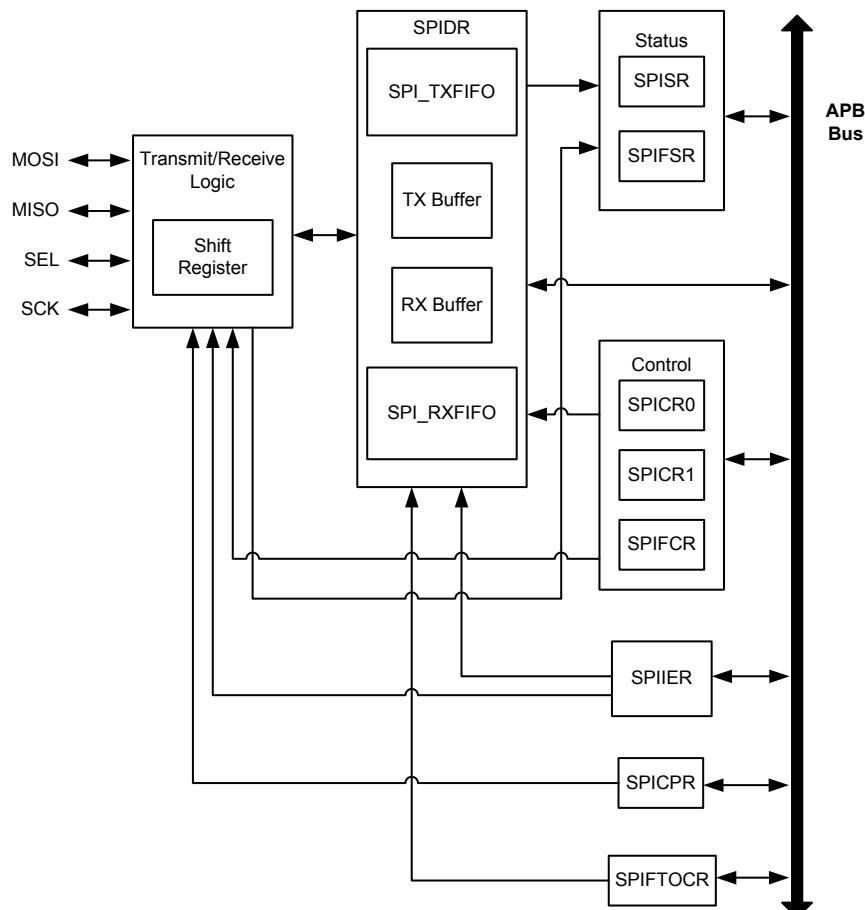

Figure 110. SPI Block Diagram

Features

- Master or slave mode
- Master mode speed up to $f_{PCLK}/2$
- Slave mode speed up to $f_{PCLK}/3$
- Programmable data frame length up to 16 bits
- FIFO Depth: 8 levels
- MSB or LSB first shift selection
- Programmable slave select high or low active polarity
- Multi-master and multi-slave operation
- Master mode supports the dual output read mode of SPI series NOR Flash
- Four error flags with individual interrupt
 - Read overrun
 - Write collision
 - Mode fault
 - Slave abort

Function Descriptions

Master Mode

Each data frame can range from 1 to 16 bits in data length. The first bit of the transmitted data can be either an MSB or LSB determined by the FIRSTBIT bit in the SPICR1 register. The SPI module is configured as a master or a slave by setting the MODE bit in the SPICR1 register. When the MODE bit is set, the SPI module is configured as a master and will generate the serial clock on the SCK pin. The data stream will transmit data in the shift register to the MOSI pin on the serial clock edge. The SEL pin is active during the full data transmission. When the SELAP bit in the SPICR1 register is set, the SEL pin is active high during the complete data transactions. When the SELM bit in the SPICR1 register is set, the SEL pin will be driven by the hardware automatically and the time interval between the active SEL edge and the first edge of SCK is equal to half an SCK period.

Slave Mode

In the slave mode, the SCK pin acts as an input pin and the serial clock will be derived from the external master device. The SEL pin also acts as an input. When the SELAP bit is cleared to 0, the SEL signal is active low during the full data stream reception. When the SELAP bit is set to 1, the SEL signal will be active high during the full data stream reception.

Note: For the slave mode, the APB clock, known as f_{PCLK} , must be at least 3 times faster than the external SCK clock input frequency.

SPI Serial Frame Format

The SPI interface format is based on the Clock Polarity, CPOL, and the Clock Phase, CPHA, configurations.

- Clock Polarity Bit – CPOL

When the Clock Polarity bit is cleared to 0, the SCK line idle state is LOW. When the Clock Polarity bit is set to 1, the SCK line idle state is HIGH.

- Clock Phase Bit – CPHA

When the Clock Phase bit is cleared to 0, the data is sampled on the first SCK clock transition.

When the Clock Phase bit is set to 1, the data is sampled on the second SCK clock transition.

There are four formats contained in the SPI interface. Table 41 shows how to configure these formats by setting the FORMAT field in the SPICR1 register.

Table 41. SPI Interface Format Setup

FORMAT [2:0]	CPOL	CPHA
001	0	0
010	0	1
110	1	0
101	1	1
Others	Reserved	

CPOL = 0, CPHA = 0

In this format, the received data is sampled on the SCK line rising edge while the transmitted data is changed on the SCK line falling edge. In the master mode, the first bit is driven when data is written into the SPIDR Register. In the slave mode, the first bit is driven when the SEL signal goes to an active level. Figure 111 shows the single byte data transfer timing of this format.

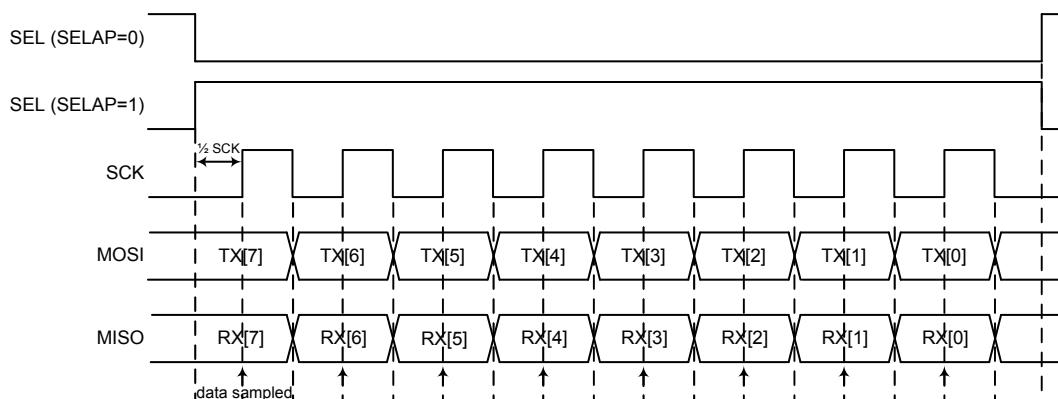

Figure 111. SPI Single Byte Transfer Timing Diagram – CPOL = 0, CPHA = 0

Figure 112 shows the continuous data transfer timing diagram of this format. Note that the SEL signal must change to an inactive level between each data frame.

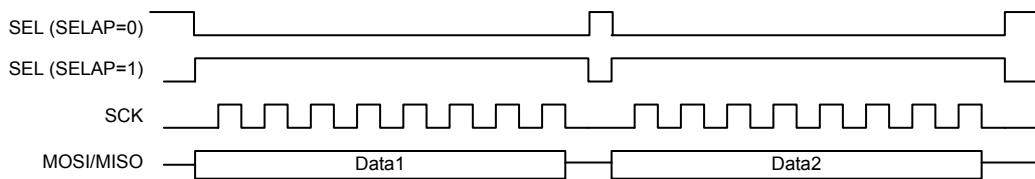

Figure 112. SPI Continuous Data Transfer Timing Diagram – CPOL = 0, CPHA = 0

CPOL = 0, CPHA = 1

In this format, the received data is sampled on the SCK line falling edge while the transmitted data is changed on the SCK line rising edge. In the master mode, the first bit is driven when data is written into the SPIDR register. In the slave mode, the first bit is driven at the first SCK clock rising edge. Figure 113 shows the single data byte transfer timing.

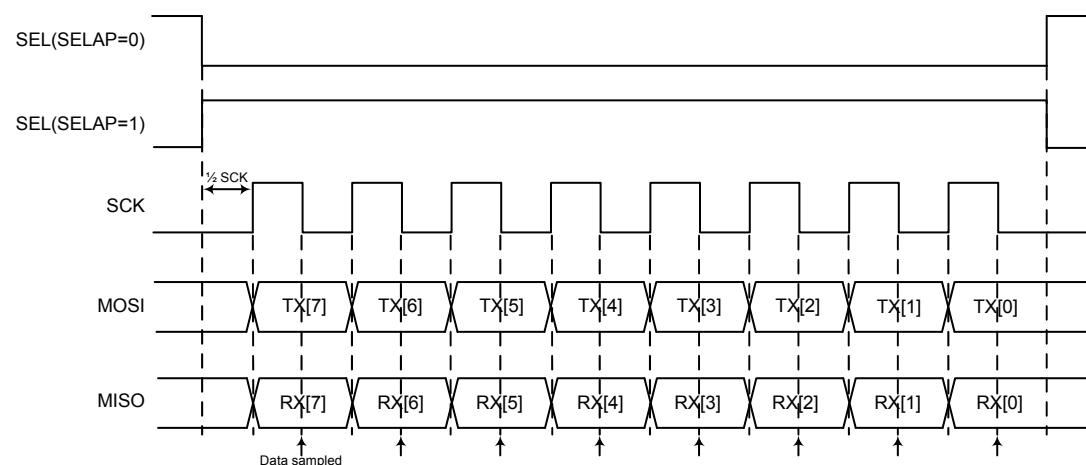

Figure 113. SPI Single Byte Transfer Timing Diagram – CPOL = 0, CPHA = 1

Figure 114 shows the continuous data transfer diagram timing. Note that the SEL signal must remain active until the last data transfer has completed.

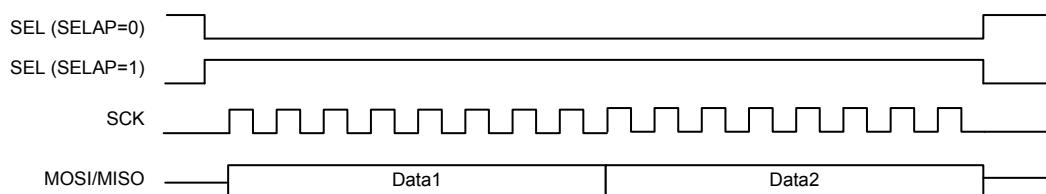

Figure 114. SPI Continuous Transfer Timing Diagram – CPOL = 0, CPHA = 1

CPOL = 1, CPHA = 0

In this format, the received data is sampled on the SCK line falling edge while the transmitted data is changed on the SCK line rising edge. In the master mode, the first bit is driven when data is written into the SPIDR register. In the slave mode, the first bit is driven when the SEL signal changes to an active level. Figure 115 shows the single byte transfer timing of this format.

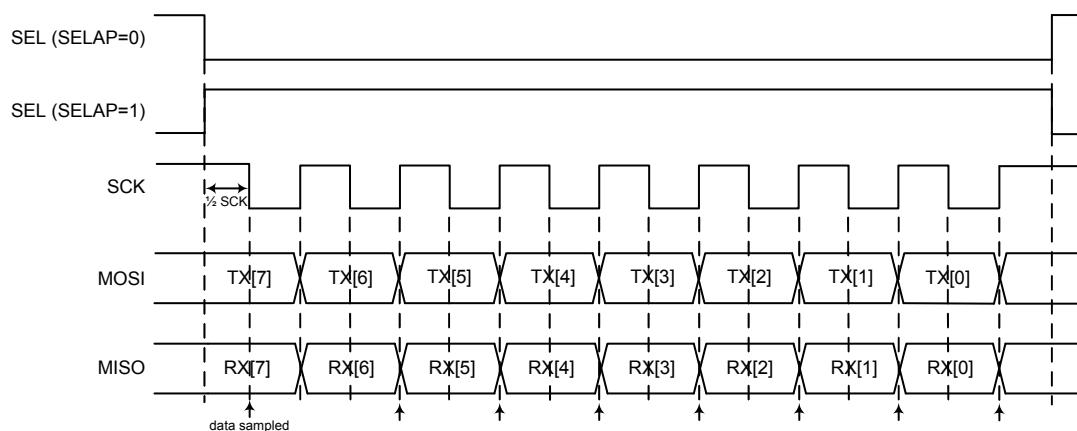

Figure 115. SPI Single Byte Transfer Timing Diagram – CPOL = 1, CPHA = 0

Figure 116 shows the continuous data transfer timing of this format. Note that the SEL signal must change to an inactive level between each data frame.

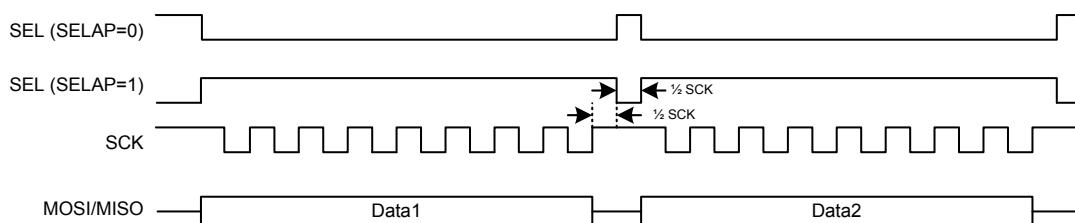

Figure 116. SPI Continuous Transfer Timing Diagram – CPOL = 1, CPHA = 0

CPOL = 1, CPHA = 1

In this format, the received data is sampled on the SCK line rising edge while the transmitted data is changed on the SCK line falling edge. In the master mode, the first bit is driven when data is written into the SPIDR register. In the slave mode, the first bit is driven at the first SCK falling edge. Figure 117 shows the single byte transfer timing of this format.

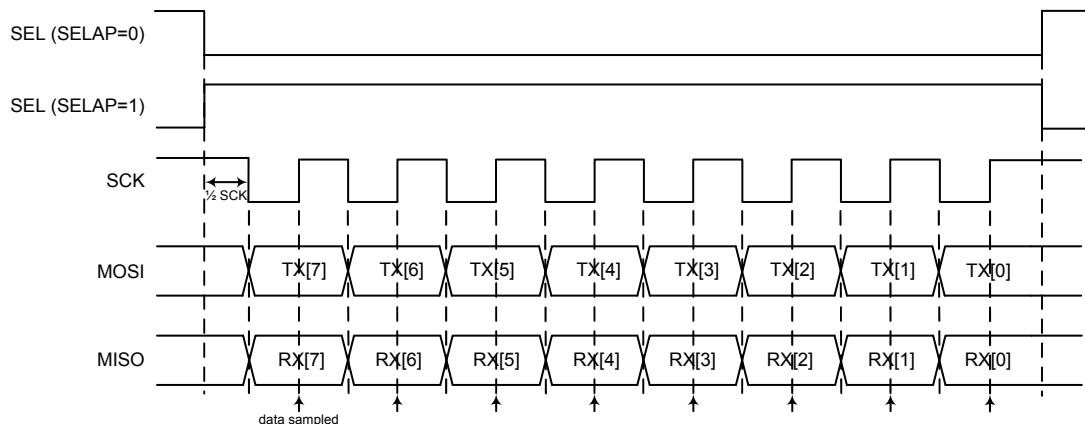

Figure 117. SPI Single Byte Transfer Timing Diagram – CPOL = 1, CPHA = 1

Figure 118 shows the continuous data transfer timing of this format. Note that the SEL signal must remain active until the last data transfer has completed.

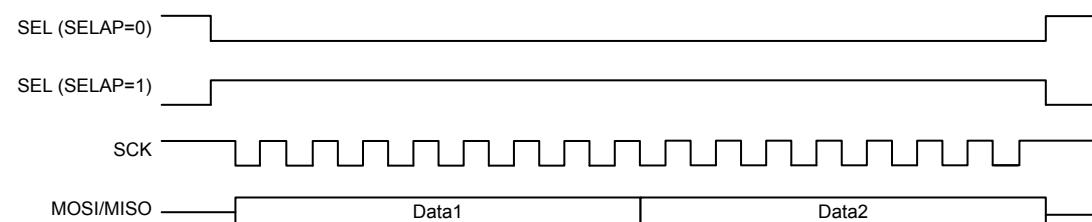

Figure 118. SPI Continuous Transfer Timing Diagram – CPOL = 1, CPHA = 1

Status Flags

TX Buffer Empty – TXBE

This TXBE flag is set when the TX buffer is empty in the non-FIFO mode or when the TX FIFO data length is equal to or less than the TX FIFO threshold level as defined by the TXFTLS field in the SPIFCR register in the FIFO mode. The following data to be transmitted can then be loaded into the buffer again. After this, the TXBE flag will be reset when the TX buffer already contains new data in the non-FIFO mode or when the TX FIFO data length is greater than the TX FIFO threshold level determined by the TXFTLS bits in the FIFO mode.

Transmission Register Empty – TXE

This TXE flag is set when both the TX buffer and the TX shift registers are empty. It will be reset when the TX buffer or the TX shift register contains new transmitted data.

RX Buffer Not Empty – RXBNE

This RXBNE flag is set when there is valid received data in the RX buffer in the non-FIFO mode or the RX FIFO data length is equal to or greater than the RX FIFO threshold level as defined by the RXFTLS field in the SPIFCR register in the SPI FIFO mode. This flag will be automatically cleared by hardware when the received data have been read out from the RX buffer totally in the non-FIFO mode or when the RX FIFO data length is less than the RX FIFO threshold level set in the RXFTLS field.

Time Out Flag – TO

The time out function is only available in the SPI FIFO mode and is disabled by loading a zero value into the TOC field in the Time Out Counter register. The timeout counter will start counting if the SPI RX FIFO is not empty, once data is read from the SPIDR register or new data is received, the timeout counter will be reset to 0 and count again. When the timeout counter value is equal to the value specified by the TOC field in the SPIFTOCR register, the TO flag will be set. The flag is cleared by writing 1 to this bit.

Mode Fault – MF

The mode fault flag can be used to detect SPI bus usage in the SPI multi-master mode. For the multi-master mode, the SPI module is configured as a master device and the SEL signal is setup as an input signal. The mode fault flag is set when the SPI SEL pin is suddenly changed to an active level by another SPI master. This means that another SPI master is requesting to use the SPI bus. Therefore, when an SPI mode fault occurs, it will force the SPI module to operate in the slave mode and also disable all of the SPI interface signals to avoid SPI bus signal collisions. For the same reason, if the SPI master wants to transfer data, it also needs to inform other SPI masters by driving its SEL signal to an active state. The detailed configuration diagram for the SPI multi-master mode is shown in the following figure.

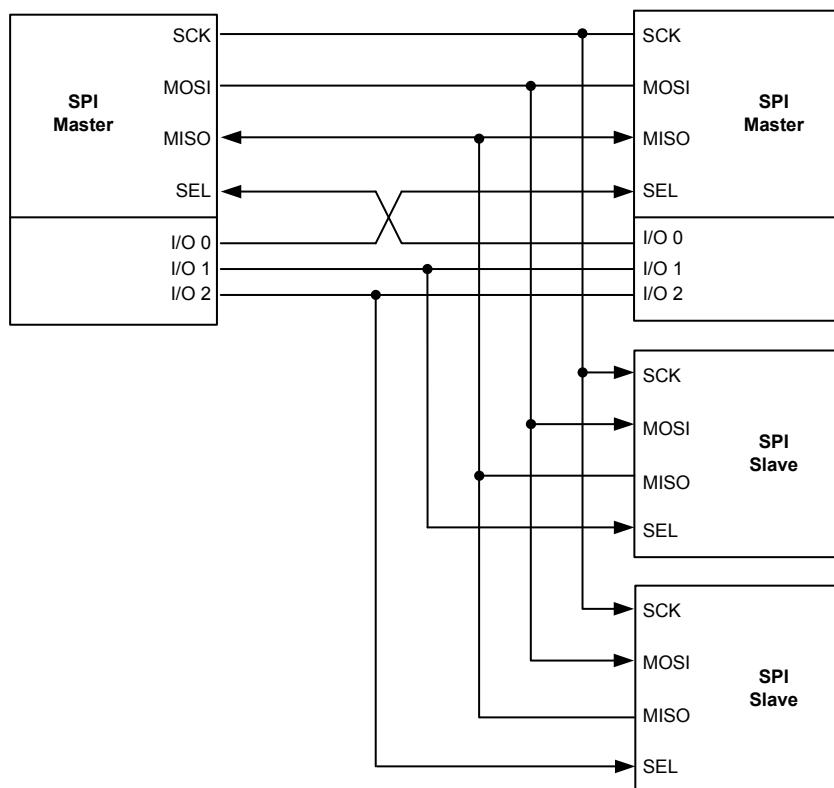

Figure 119. SPI Multi-Master Slave Environment

Table 42. SPI Mode Fault Trigger Conditions

Mode Fault	Descriptions
Trigger condition	1. SPI Master mode 2. SELOEN = 0 in the SPICR0 register – SEL pin is configured to be the input mode 3. SEL signal changes to an active level when driven by the external SPI master
SPI behavior	1. Mode fault flag is set. 2. The SPIEN bit in the SPICR0 register is reset. This disables the SPI interface and blocks all output signals from the device. 3. The MODE bit in the SPICR1 register is reset. This forces the device into slave mode.

Table 43. SPI Master Mode SEL Pin Status

	SEL as Input – SELOEN = 0		SEL as Output – SELOEN = 1	
Multi-master	Support		Not support	
SPI SEL control signal	Use Another GPIO to replace the SEL pin function		SEL pin in hardware or software control mode - using SELM setting	
Continuous transfer	Case 1	Case 2	Case 1	Case 2
	Not support	Support	Hardware control	Hardware or software control

Case 1: SEL signal must be inactive between each data transfer.

Case 2: SEL signal will not to be inactive until the last data frame has finished.

Note: When the SPI is in the slave mode, the SEL signal is always an input and not affected by the SELOEN bit in the SPICR0 register.

Write Collision – WC

The following conditions will assert the Write Collision Flag.

- The FIFOEN bit in the SPIFCR register is cleared

The write collision flag is asserted when new data is written into the SPIDR register while both the TX buffer and the shift register are already full. Any new data written into the TX buffer will be lost.

- The FIFOEN bit in the SPIFCR register is set

The write collision flag is asserted to indicate that new data is written into the SPIDR register while both the TX FIFO and the TX shift register are already full. Any new data written into the TX FIFO will be lost.

Read Overrun – RO

- The FIFOEN bit in the SPIFCR register is cleared

The read overrun flag is asserted to indicate that both the RX shift register and the RX buffer are already full, if one more data is received. This will result in the newly received data not being shifted into the SPI shift register. As a result the latest received data will be lost.

- The FIFOEN bit in the SPIFCR register is set

The read overrun flag is set to indicate that the RX shift register and the RX FIFO are both full, if one more data is received. This means that the latest received data can not be shifted into the SPI shift register. As a result the latest received data will be lost.

Slave Abort – SA

In the SPI slave mode, the slave abort flag is set to indicate that the SEL pin suddenly changed to an inactive state during the reception of a data frame transfer. The data frame length is set by the DFL field in the SPICR1 register.

Register Map

The following table shows the SPI registers and their reset values.

Table 44. SPI Register Map

Register	Offset	Description	Reset Value
SPICR0	0x000	SPI Control Register 0	0x0000_0000
SPICR1	0x004	SPI Control Register 1	0x0000_0000
SPIIER	0x008	SPI Interrupt Enable Register	0x0000_0000
SPICPR	0x00C	SPI Clock Prescaler Register	0x0000_0000
SPIDR	0x010	SPI Data Register	0x0000_0000
SPISR	0x014	SPI Status Register	0x0000_0003
SPIFCR	0x018	SPI FIFO Control Register	0x0000_0000
SPIFSR	0x01C	SPI FIFO Status Register	0x0000_0000
SPIFTOCR	0x020	SPI FIFO Time Out Counter Register	0x0000_0000

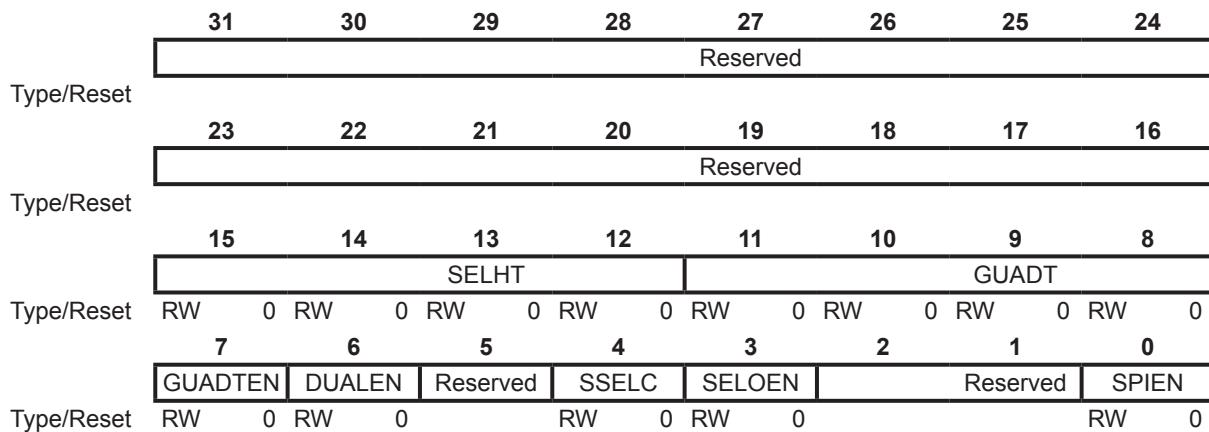

Register Descriptions

SPI Control Register 0 – SPICR0

This register specifies the SEL control and the SPI enable bits.

Offset: 0x000

Reset value: 0x0000_0000

Bits	Field	Descriptions
[15:12]	SELHT	Chip Select Hold Time 0x0: 1/2 SCK 0x1: 1 SCK 0x2: 3/2 SCK 0x3: 2 SCK ... Note that SELHT is for master mode only.
[11:8]	GUADT	Guard Time GUADTEN = 1 0x0: 1 SCK 0x1: 2 SCK 0x2: 3 SCK ... Note that GUADT is for master mode only.
[7]	GUADTEN	Guard Time Enable 0: Guard Time is 1/2 SCK 1: When this bit is set, Guard time can be controlled by GUADT Note that GUADTEN is for master mode only.
[6]	DUALEN	Dual Port Enable 0: Dual port is disabled 1: Dual port is enabled The control bit is used to support the dual output read mode of the series SPI NOR Flash. When this bit is set and the MOSI signal will change the direction from output to input and receive the series data stream. That means the DUALEN control bit is only for master mode.

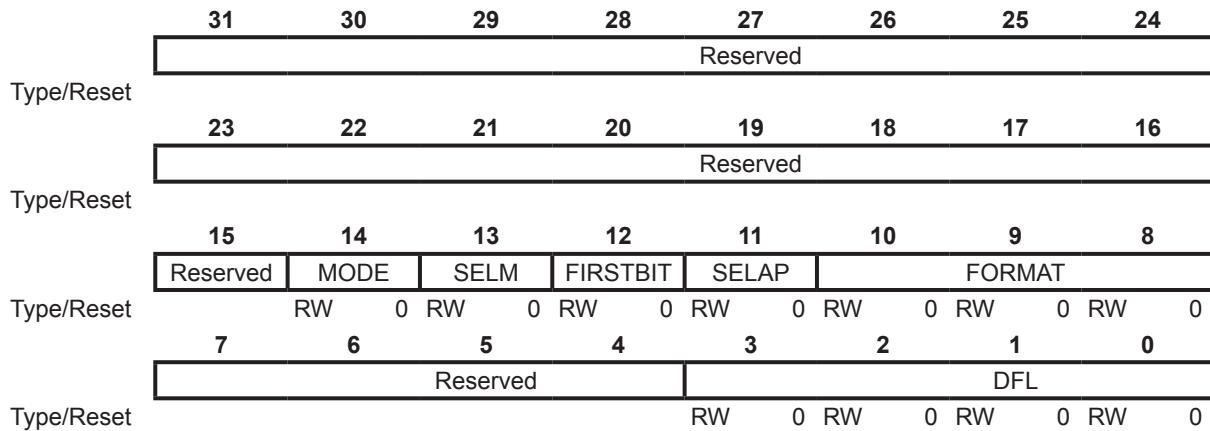

Bits	Field	Descriptions
[4]	SSEL _C	<p>Software Slave Select Control</p> <p>0: Set the SEL output to an inactive state 1: Set the SEL output to an active state</p> <p>The application software can setup the SEL output to an active or inactive state by configuring the SSEL_C bit. The active level is configured by the SELAP bit in the SPICR1 register. Note that the SSEL_C bit is only available when the SELOEN bit is set to 1 for enabling the SEL output meanwhile the SELM bit is cleared to 0 for controlling the SEL signal by software. Otherwise, the SSEL_C bit has no effect.</p>
[3]	SELOEN	<p>Slave Select Output Enable</p> <p>0: Set the SEL signal to the input mode for multi-master mode 1: Set the SEL signal to the output mode for slave select</p> <p>The SELOEN is only available in the master mode to setup the SEL signal as an input or output signal. When the SEL signal is configured to operate in the output mode, it is used as a slave select signal in either the hardware or software mode according to the SELM bit setting in the SPICR1 register. The SEL signal is used for mode fault detection in the multi-master environment when it is configured to operate in the input mode.</p>
[0]	SPIEN	<p>SPI Enable</p> <p>0: SPI interface is disabled 1: SPI interface is enabled</p>

SPI Control Register 1 – SPICR1

This register specifies the SPI parameters including the data length, the transfer format, the SEL active polarity / mode, the LSB / MSB control and the master / slave mode.

Offset: 0x004

Reset value: 0x0000_0000

Bits	Field	Descriptions
[14]	MODE	Master or Slave Mode 0: Slave mode 1: Master mode
[13]	SELM	Slave Select Mode 0: SEL signal is controlled by software – asserted or de-asserted by the SSELC bit 1: SEL signal is controlled by hardware – generated automatically by the SPI hardware Note that the SELM bit is available for master mode only – MODE = 1.
[12]	FIRSTBIT	LSB or MSB Transmitted First 0: MSB is transmitted first 1: LSB is transmitted first
[11]	SELAP	Slave Select Active Polarity 0: SEL signal is active low 1: SEL signal is active high
[10:8]	FORMAT	SPI Data Transfer Format These three bits are used to determine the data transfer format of the SPI interface.

FORMAT [2:0]	CPOL	CPHA
001	0	0
010	0	1
110	1	0
101	1	1
Others	Reserved	

CPOL: Clock Polarity

0: SCK Idle state is low

1: SCK Idle state is high

CPHA: Clock Phase

0: Data is captured on the first SCK clock edge

1: Data is captured on the second SCK clock edge

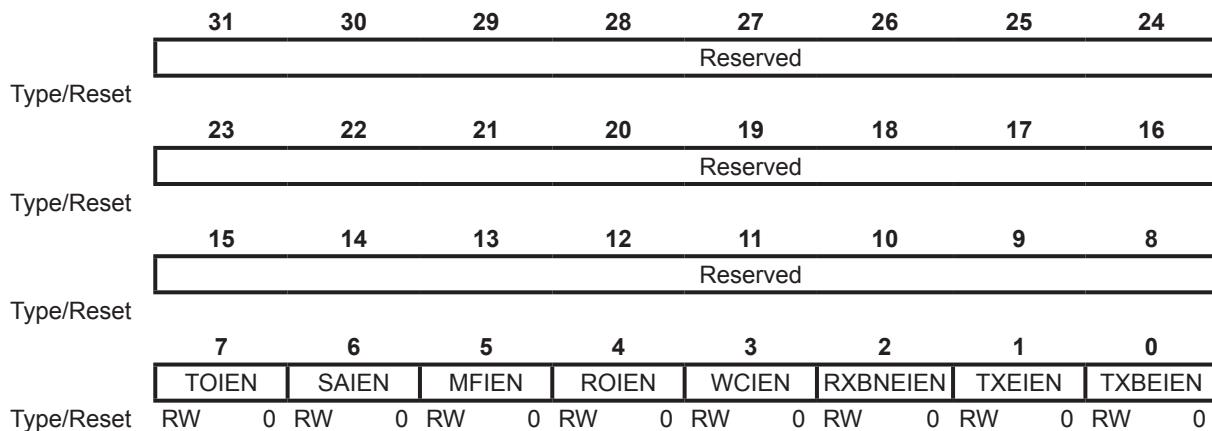

Bits	Field	Descriptions
[3:0]	DFL	Data Frame Length Selects the data transfer frame from 1 bit to 16 bits. 0x1: 1 bit 0x2: 2 bits ... 0xF: 15 bits 0x0: 16 bits

SPI Interrupt Enable Register – SPIIER

This register contains the corresponding SPI interrupt enable control bit.

Offset: 0x008

Reset value: 0x0000_0000

Bits	Field	Descriptions
[7]	TOIEN	Time Out Interrupt Enable 0: Disable 1: Enable
[6]	SAIEN	Slave Abort Interrupt Enable 0: Disable 1: Enable
[5]	MFIEN	Mode Fault Interrupt Enable 0: Disable 1: Enable
[4]	ROIEN	Read Overrun Interrupt Enable 0: Disable 1: Enable
[3]	WCien	Write Collision Interrupt Enable 0: Disable 1: Enable

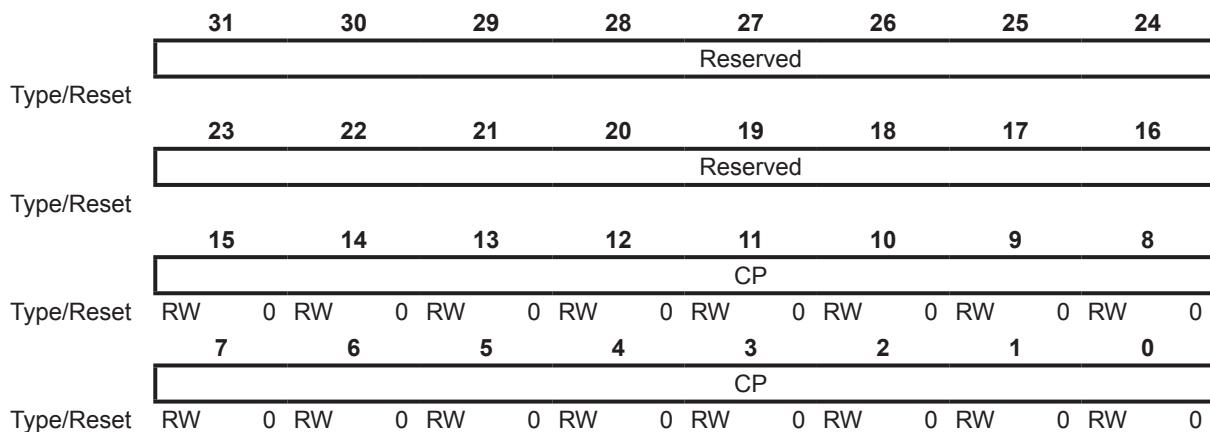

Bits	Field	Descriptions
[2]	RXBNEIEN	RX Buffer Not Empty Interrupt Enable 0: Disable 1: Enable Generates an interrupt request when the RXBNE flag is set and when RXBNEIEN is set. In the FIFO mode, the interrupt request being generated depends upon the RX FIFO trigger level setting.
[1]	TXEIEN	TX Empty Interrupt Enable 0: Disable 1: Enable The TX register empty interrupt request will be generated when the TXE flag and the TXEIEN bit are set.
[0]	TXBEIEN	TX Buffer Empty Interrupt Enable 0: Disable 1: Enable The TX buffer empty interrupt request will be generated when the TXBE flag and the TXBEIEN bit are set. In the FIFO mode, the interrupt request being generated depends upon the TX FIFO trigger level setting.

SPI Clock Prescaler Register – SPICPR

This register specifies the SPI clock prescaler ratio.

Offset: 0x00C

Reset value: 0x0000_0000

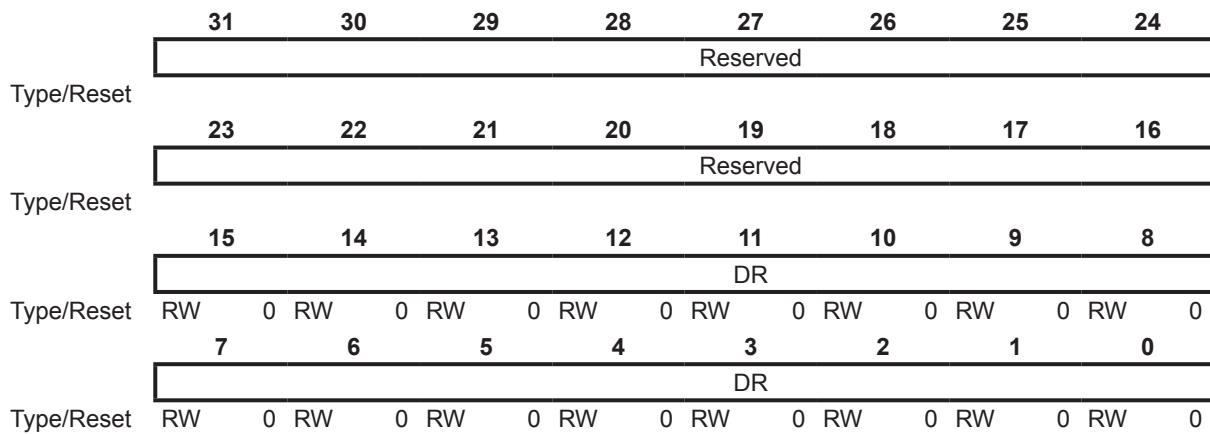

Bits	Field	Descriptions
[15:0]	CP	SPI Clock Prescaler The SPI clock (SCK) is determined by the following equation: $f_{SCK} = f_{PCLK} / (2 \times (CP + 1))$, where the CP ranges is from 0 to 65535 Note: For the SPI slave mode, the system clock (f_{PCLK}) must be at least 3 times faster than the external SPI SCK input.

SPI Data Register – SPIDR

This register stores the SPI received or transmitted Data.

Offset: 0x010

Reset value: 0x0000_0000

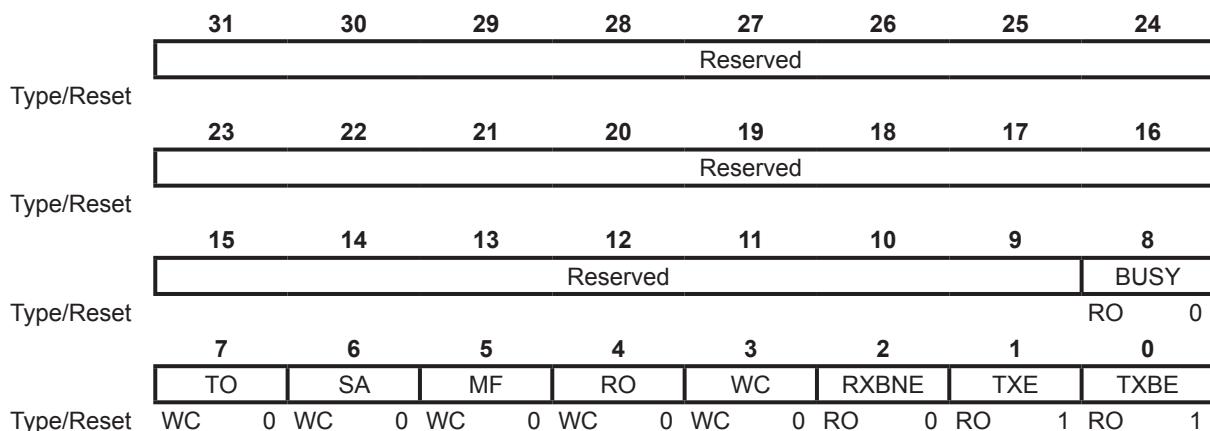

Bits	Field	Descriptions
[15:0]	DR	<p>Data Register</p> <p>The SPI data register is used to store the serial bus transmitted or received data. In the non-FIFO mode, writing data into the SPI data register will also load the data into the data transmission buffer, known as the TX buffer. Reading data from the SPI data register will return the data held in the data received buffer, named RX buffer.</p>

SPI Status Register – SPISR

This register contains the relevant SPI status.

Offset: 0x014

Reset value: 0x0000_0003

Bits	Field	Descriptions
[8]	BUSY	SPI Busy flag 0: SPI not busy 1: SPI busy In the master mode, this flag is reset when the TX buffer and TX shift register are both empty and is set when the TX buffer or the TX shift register are not empty. In the slave mode, this flag is set when SEL changes to an active level and is reset when SEL changes to an inactive level.
[7]	TO	Time Out flag 0: No RX FIFO time out 1: RX FIFO time out has occurred Write 1 to clear it. Once the timeout counter value is equal to the TOC field setting in the SPIFTOCR register, the time out flag will be set and an interrupt will be generated if the TOIEN bit in the SPIIER register is enabled. This bit is cleared by writing 1. Note: This Time Out flag function is only available in the SPI FIFO mode.
[6]	SA	Slave Abort flag 0: No slave abort 1: Slave abort has occurred This bit is set by hardware and cleared by writing 1.
[5]	MF	Mode Fault flag 0: No mode fault 1: Mode fault has occurred This bit is set by hardware and cleared by writing 1.
[4]	RO	Read Overrun flag 0: No read overrun 1: Read overrun has occurred This bit is set by hardware and cleared by writing 1.

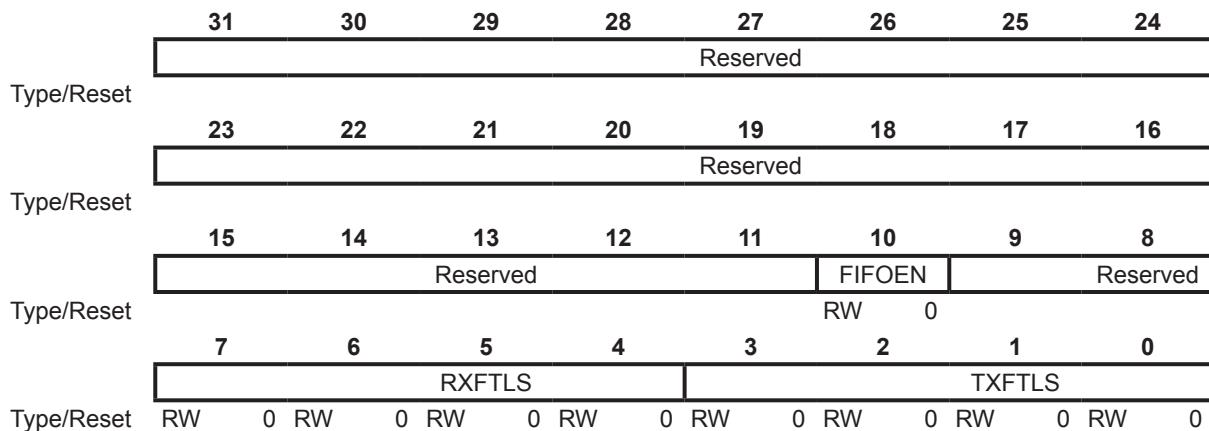

Bits	Field	Descriptions
[3]	WC	Write Collision flag 0: No write collision 1: Write collision has occurred This bit is set by hardware and cleared by writing 1.
[2]	RXBNE	Receive Buffer Not Empty flag 0: RX buffer is empty 1: RX buffer not empty This bit indicates the RX buffer status in the non-FIFO mode. It is also used to indicate if the RX FIFO trigger level has been reached in the FIFO mode. This bit will be cleared when the SPI RX buffer is empty in the non-FIFO mode or if the number of data contained in RX FIFO is less than the trigger level which is specified by the RXFTLS field in the SPIFCR register in the SPI FIFO mode.
[1]	TXE	Transmission Register Empty flag 0: TX buffer or TX shift register is not empty 1: TX buffer and TX shift register both are empty
[0]	TXBE	Transmit Buffer Empty flag 0: TX buffer is not empty 1: TX buffer is empty In the FIFO mode, this bit, if set, indicates that the number of data contained in TX FIFO is equal to or less than the trigger level specified by the TXFTLS field in the SPIFCR register.

SPI FIFO Control Register – SPIFCR

This register contains the related SPI FIFO control including the FIFO enable control and the FIFO trigger level selections.

Offset: 0x018

Reset value: 0x0000_0000

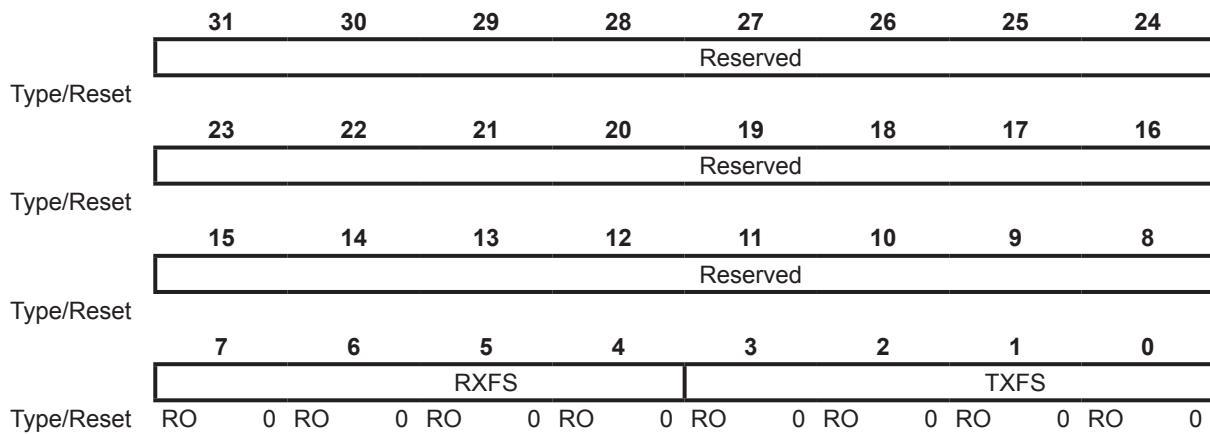

Bits	Field	Descriptions
[10]	FIFOEN	FIFO Enable 0: FIFO disable 1: FIFO enable This bit cannot be set or reset when the SPI interface is in transmitting.
[7:4]	RXFTLS	RX FIFO Trigger Level Select 0000: Trigger level is 0 0001: Trigger level is 1 ... 1000: Trigger level is 8 Others: Reserved The RXFTLS field is used to specify the RX FIFO trigger level. When the number of data contained in the RX FIFO is equal to or greater than the trigger level defined by the RXFTLS field, the RXBNE flag will be set.
[3:0]	TXFTLS	TX FIFO Trigger Level Select 0000: Trigger level is 0 0001: Trigger level is 1 ... 1000: Trigger level is 8 Others: Reserved The TXFTLS field is used to specify the TX FIFO trigger level. When the number of data contained in the TX FIFO is equal to or less than the trigger level defined by the TXFTLS field, the TXBE flag will be set.

SPI FIFO Status Register – SPIFSR

This register contains the relevant SPI FIFO status.

Offset: 0x01C

Reset value: 0x0000_0000

Bits	Field	Descriptions
[7:4]	RXFS	<p>RX FIFO Status</p> <p>0000: RX FIFO empty 0001: RX FIFO contains 1 data ... 1000: RX FIFO contains 8 data Others: Reserved</p>
[3:0]	TXFS	<p>TX FIFO Status</p> <p>0000: TX FIFO empty 0001: TX FIFO contains 1 data ... 1000: TX FIFO contains 8 data Others: Reserved</p>

SPI FIFO Time Out Counter Register – SPIFTOCR

This register stores the SPI RX FIFO timeout counter value.

Offset: 0x020

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24	
Type/Reset	Reserved								
	23	22	21	20	19	18	17	16	
Type/Reset	Reserved								
	15	14	13	12	11	10	9	8	
Type/Reset	RW	0	RW	0	RW	0	RW	0	
	7	6	5	4	3	2	1	0	
Type/Reset	RW	0	RW	0	RW	0	RW	0	
	TOC								

Bits	Field	Descriptions
[15:0]	TOC	<p>Time Out Counter</p> <p>The timeout counter starts to count from 0 after the SPI RX FIFO receives a data, and reset the counter value once the data is read from the SPIDR register by software or another new data is received. If the FIFO does not receive new data or the software does not read data from the SPIDR register the timeout counter value will continuously increase. When the timeout counter value is equal to the TOC setting value, the TO flag in the SPISR register will be set and an interrupt will be generated if the TOIEN bit in the SPIIEN register is set. The timeout counter will be stopped when the RX FIFO is empty. The SPI FIFO timeout function can be disabled by setting the TOC field to zero. The timeout counter is driven by the system APB clock, named f_{PCLK}.</p>

Universal Asynchronous Receiver Transmitter (UART)

Introduction

The Universal Asynchronous Receiver Transceiver, UART, provides a flexible full duplex data exchange using asynchronous transfer. The UART is used to translate data between parallel and serial interfaces, and is also commonly used for RS232 standard communication. The UART peripheral function supports a variety of interrupts.

The UART module includes a transmit data register TDR and transmit shift register TSR, and a receive data register RDR and receive shift register RSR. Software can detect a UART error status by reading the UART Status & Interrupt Flag Register, URSIFR. The status includes the condition of the transfer operations as well as several error conditions resulting from Parity, Overrun, Framing and Break events.

The UART includes a programmable baud rate generator which is capable of dividing the UART clock of the CK_APB (CK_UART) to produce a baud rate clock for the UART transmitter and receiver.

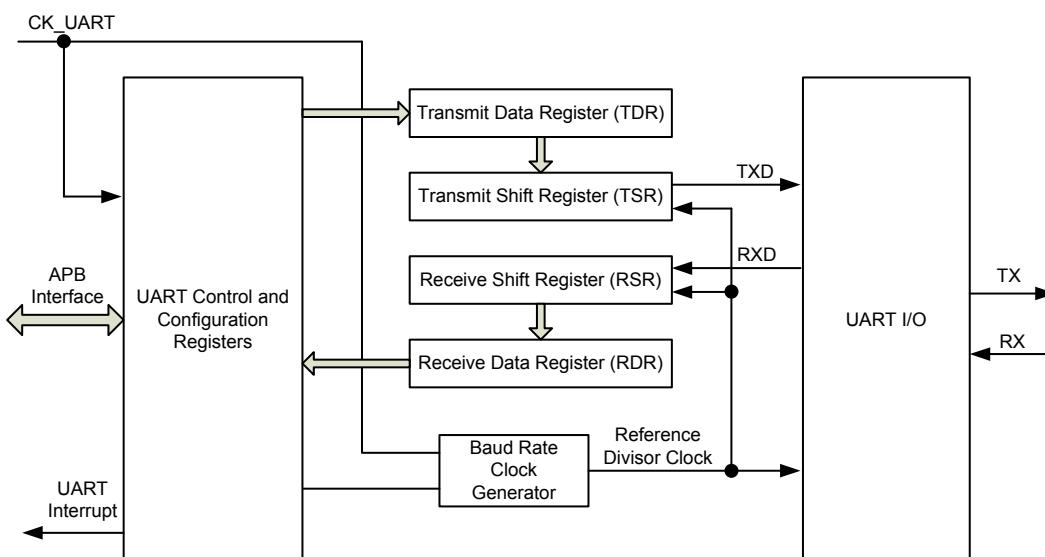

Figure 120. UART Block Diagram

Features

- Supports asynchronous serial communication modes
- Full Duplex Communication Capability
- Programming baud rate clock frequency up to ($f_{PCLK}/16$) MHz
- Fully programmable serial communication functions including:
 - Word length: 7, 8 or 9-bit character
 - Parity: Even, odd or no-parity bit generation and detection
 - Stop bit: 1 or 2 stop bits generation
 - Bit order: LSB-first or MSB-first transfer
- Error detection: Parity, overrun and frame error

Function Descriptions

Serial Data Format

The UART module performs a parallel-to-serial conversion on data that is written to the transmit data register and then sends the data with the following format: Start bit, 7 ~ 9 LSB / MSB first data bits, optional Parity bit and finally 1 ~ 2 Stop bits. The Start bit has the opposite polarity of the data line idle state. The Stop bit is the same as the data line idle state and provides a delay before the next start situation. Both the Start and Stop bits are used for data synchronization during the asynchronous data transmission.

The UART module also performs a serial-to-parallel conversion on the data that is read from the receive data register. It will first check the Parity bit and will then look for a Stop bit. If the Stop bit is not found, the UART module will consider the entire word transmission to have failed and respond with a Framing Error.

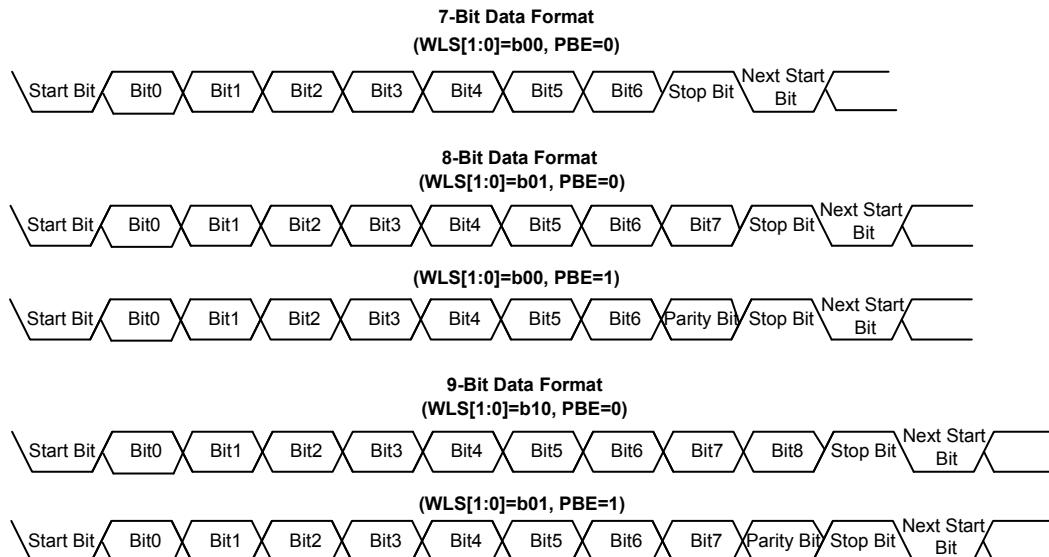

Figure 121. UART Serial Data Format

Baud Rate Generation

The baud rate for the UART receiver and transmitter are both set with the same values. The baud-rate divisor, BRD, has the following relationship with the UART clock which is known as CK_UART.

$$\text{Baud Rate Clock} = \text{CK_UART} / \text{BRD}$$

Where CK_UART clock is the APB clock connected to the UART while the BRD range is from 16 to 65535.

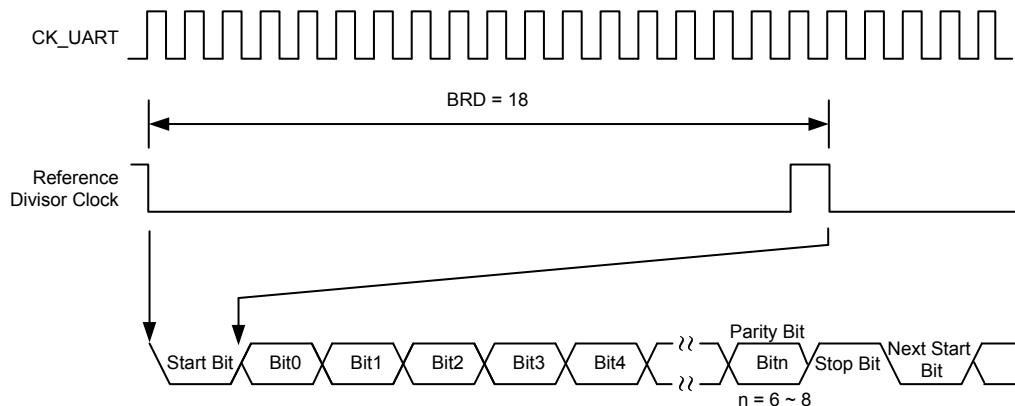

Figure 122. UART Clock CK_UART and Data Frame Timing

Table 45. Baud Rate Deviation Error Calculation – CK_UART = 20 MHz

Baud Rate		CK_UART = 20 MHz		
No.	Kbps	Actual	BRD	Deviation Error Rate
1	2.4	2.4	8333	0.00%
2	9.6	9.6	2083	0.02%
3	19.2	19.2	1042	-0.03%
4	57.6	57.6	347	0.06%
5	115.2	114.9	174	-0.22%
6	230.4	229.9	87	-0.22%
7	460.8	465.1	43	0.94%
8	921.6	909.1	22	-1.36%
9	1250	1250	16	0%

Table 46. Baud Rate Deviation Error Calculation – CK_UART = 10 MHz

Baud Rate		CK_UART = 10 MHz		
No.	Kbps	Actual	BRD	Deviation Error Rate
1	2.4	2.4	4167	-0.01%
2	9.6	9.6	1042	-0.03%
3	19.2	19.2	521	-0.03%
4	57.6	57.6	174	-0.22%
5	115.2	114.9	87	-0.22%
6	230.4	232.6	43	0.94%
7	460.8	454.5	22	-1.36%
8	625	625	16	0%

Interrupts and Status

The UART can generate interrupts when the following event occurs and the corresponding interrupt enable bits are set:

- Receiver line status interrupts: The interrupts are generated when the overrun error, parity error, framing error or break event occurs for the UART receiver.
- Transmit data register empty interrupt: An interrupt is generated when the content of the transmit data register is transferred to the transmit shift register (TSR).
- Transmit complete interrupt: An interrupt is generated when the transmit data register (TDR) is empty and the content of the transmit shift register (TSR) is also completely shifted.
- Receive data ready interrupt: An interrupt is generated when the content of the receive shift register RDR has been transferred to the URDR register and is ready to read.

Register Map

The following table shows the UART registers and reset values.

Table 47. UART Register Map

Register	Offset	Description	Reset Value
URDR	0x000	UART Data Register	0x0000_0000
URCR	0x004	UART Control Register	0x0000_0000
URIER	0x00C	UART Interrupt Enable Register	0x0000_0000
URSIFR	0x010	UART Status & Interrupt Flag Register	0x0000_0180
URDLR	0x024	UART Divider Latch Register	0x0000_0010
URTSTR	0x028	UART Test Register	0x0000_0000

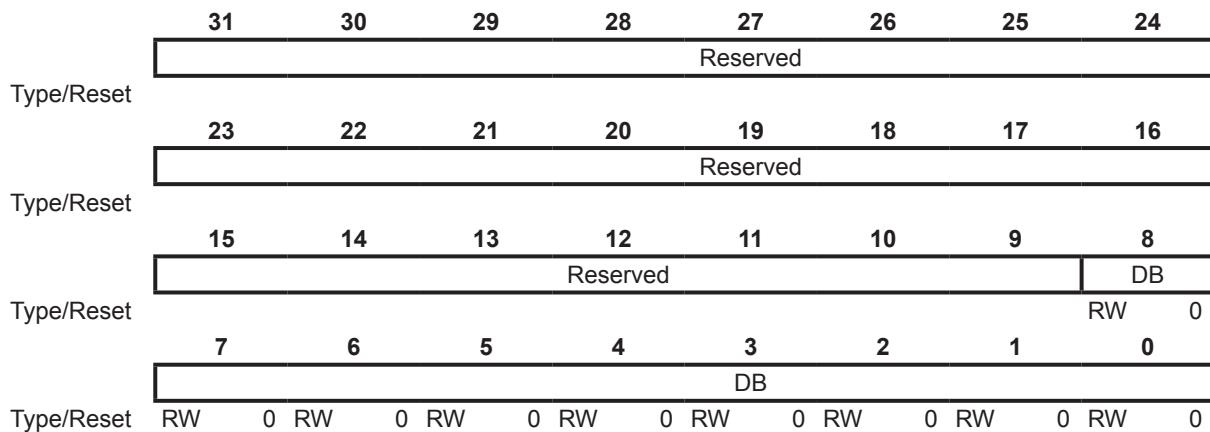

Register Descriptions

UART Data Register – URDR

The register is used to access the UART transmitted and received data.

Offset: 0x000

Reset value: 0x0000_0000

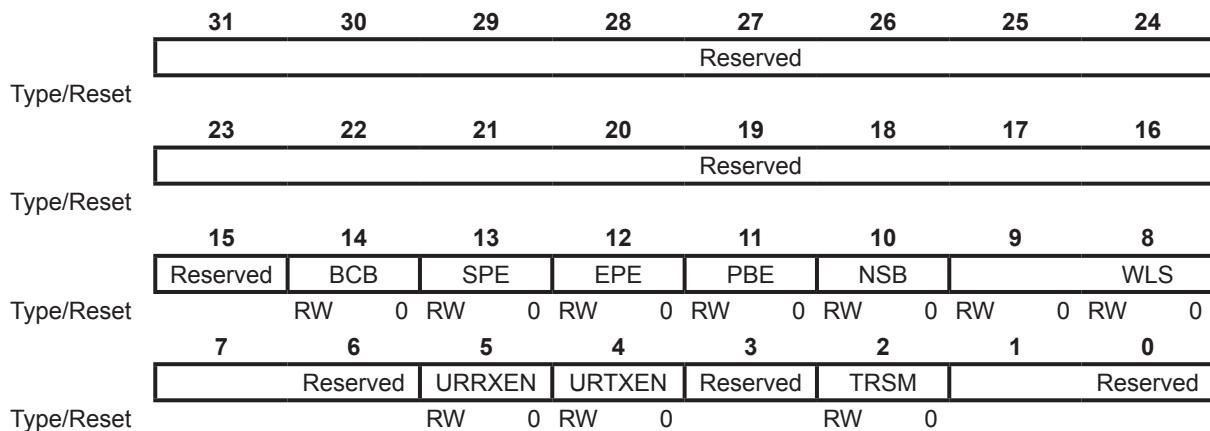

Bits	Field	Descriptions
[8:0]	DB	<p>By reading this register, the UART will return a 7, 8 and 9-bit received data. The DB field bit 8 is valid for the 9-bit mode only and is fixed at 0 for the 8-bit mode. For the 7-bit mode, the DB[6:0] contains the available bits.</p> <p>By writing to this register, the UART will send out 7, 8 or 9-bit transmitted data. The DB field bit 8 is valid for the 9-bit mode only and will be ignored for the 8-bit mode. For the 7-bit mode, the DB[6:0] field contains the available bits.</p>

UART Control Register – URCR

The register specifies the serial parameters such as data length, parity and stop bit for the UART.

Offset: 0x004

Reset value: 0x0000_0000

Bits	Field	Descriptions
[14]	BCB	Break Control Bit When this bit is set to 1, the serial data output on the UART TX pin will be forced to the Spacing State (logic 0). This bit acts only on the UART TX output pin and has no effect on the transmitter logic.
[13]	SPE	Stick Parity Enable 0: Disable stick parity 1: Stick Parity bit is transmitted This bit is only available when the PBE bit is set to 1. If both the PBE and SPE bits are set to 1 and the EPE bit is cleared to 0, the transmitted parity bit will be stuck to 1. However, when the PBE and SPE bits are set to 1 and also the EPE bit is set to 1, the transmitted parity bit will be stuck to 0.
[12]	EPE	Even Parity Enable 0: Odd number of logic 1's are transmitted or checked in the data word and parity bits 1: Even number of logic 1's are transmitted or checked in the data word and parity bits This bit is only available when PBE is set to 1.
[11]	PBE	Parity Bit Enable 0: Parity bit is not generated (transmitted data) and checked (receive data) during transfer 1: Parity bit is generated and checked during transfer Note: When the WLS field is set to "10" to select the 9-bit data format, writing to the PBE bit has no effect.
[10]	NSB	Number of "STOP bit" 0: One "STOP bit" is generated in the transmitted data 1: Two "STOP bit" is generated when 8- and 9-bit word length is selected
[9:8]	WLS	Word Length Select 00: 7 bits 01: 8 bits 10: 9 bits 11: Reserved

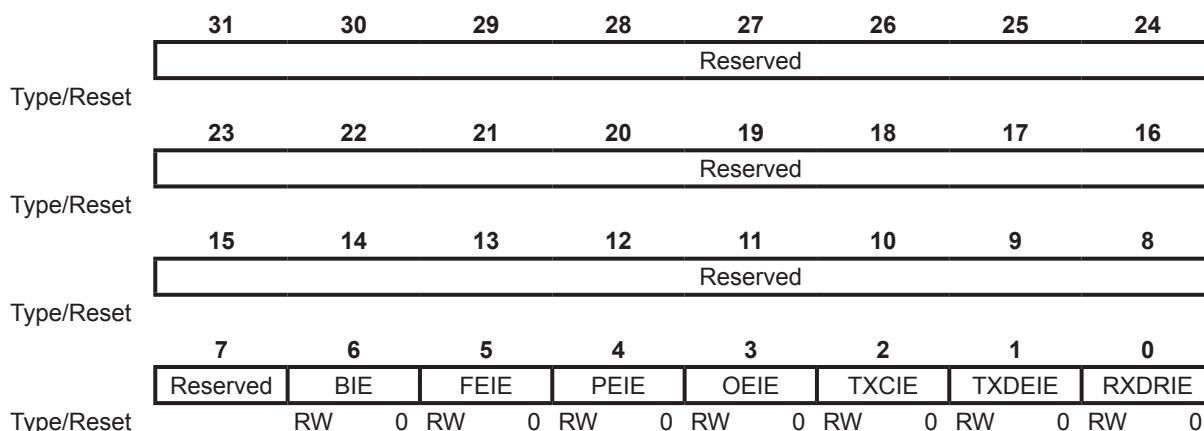

Bits	Field	Descriptions
[5]	URRXEN	UART RX Enable 0: Disable 1: Enable
[4]	URTXEN	UART TX Enable 0: Disable 1: Enable
[2]	TRSM	Transfer Mode Selection This bit is used to select the data transfer protocol. 0: LSB first 1: MSB first

UART Interrupt Enable Register – URIER

This register is used to enable the related UART interrupt function. The UART module generates interrupts to the controller when the corresponding events occur and the corresponding interrupt enable bits are set.

Offset: 0x00C

Reset value: 0x0000_0000

Bits	Field	Descriptions
[6]	BIE	Break Interrupt Enable 0: Disable interrupt 1: Enable interrupt If this bit is set, an interrupt is generated when the break interrupt is enabled and the BII bit is set in the URSIFR register.
[5]	FEIE	Framing Error Interrupt Enable 0: Disable interrupt 1: Enable interrupt If this bit is set, an interrupt is generated when the framing error interrupt is enabled and the FEI bit is set in the URSIFR register.
[4]	PEIE	Parity Error Interrupt Enable 0: Disable interrupt 1: Enable interrupt If this bit is set, an interrupt is generated when the parity error interrupt is enabled and the PEI bit is set in the URSIFR register.

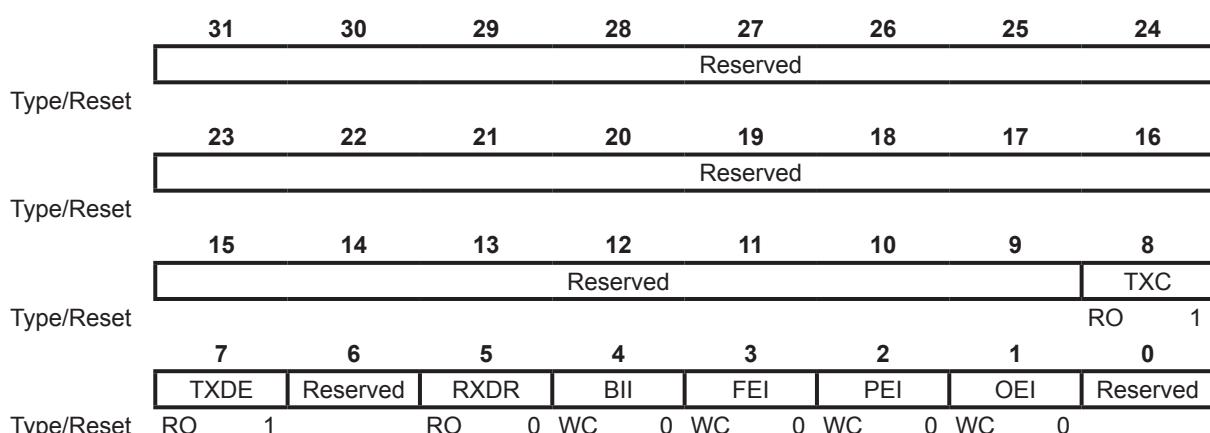

Bits	Field	Descriptions
[3]	OEIE	Overrun Error Interrupt Enable 0: Disable interrupt 1: Enable interrupt If this bit is set, an interrupt is generated when the overrun error interrupt is enabled and the OEI bit is set in the URSIFR register.
[2]	TXCIE	Transmit Complete Interrupt Enable 0: Disable interrupt 1: Enable interrupt If this bit is set, an interrupt is generated when the transmit complete interrupt is enabled and the TXC bit is set in the URSIFR register.
[1]	TXDEIE	Transmit Data Register Empty Interrupt Enable 0: Disable interrupt 1: Enable interrupt If this bit is set, an interrupt is generated when the transmit data register empty interrupt is enabled and the TXDE bit is set in the URSIFR register.
[0]	RXDRIE	Receive Data Ready Interrupt Enable 0: Disable interrupt 1: Enable interrupt If this bit is set, an interrupt is generated when the receive data ready interrupt is enabled and the RXDR bit is set in the URSIFR register.

UART Status & Interrupt Flag Register – URSIFR

This register contains the corresponding UART status.

Offset: 0x010

Reset value: 0x0000_0180

Bits	Field	Descriptions
[8]	TXC	Transmit Complete 0: Either the transmit data register (TDR) or transmit shift register (TSR) is not empty 1: Both the transmit data register (TDR) and transmit shift register (TSR) are empty An interrupt is generated if TXCIE = 1 in the URIER register. This bit is cleared by a write to the URDR register with new data.

Bits	Field	Descriptions
[7]	TXDE	<p>Transmit Data Register Empty</p> <p>0: Transmit data register is not empty 1: Transmit data register is empty</p> <p>The TXDE bit is set by hardware when the content of the transmit data register is transferred to the transmit shift register (TSR). An interrupt is generated if TXEIE = 1 in the URIER register. This bit is cleared by a write to the URDR register with a new data.</p>
[5]	RXDR	<p>RX Data Ready</p> <p>0: Receive data register is empty 1: Received data in the receive data register is ready to read</p> <p>This bit is set by hardware when the content of the receive shift register RDR has been transferred to the URDR register. An interrupt is generated if RXDRIE = 1 in the URIER register. It is cleared by a read to the URDR register.</p>
[4]	BII	<p>Break Interrupt Indicator</p> <p>This bit is set to 1 whenever the received data input is held in the “spacing state” (logic 0) for longer than a full character transmission time, which is the total time of “start bit” + “data bits” + “parity” + “stop bits” duration. Writing 1 to this bit clears the flag.</p>
[3]	FEI	<p>Framing Error Indicator</p> <p>This bit is set 1 whenever the received character does not have a valid “stop bit”, which means the stop bit following the last data bit or parity bit is detected as logic 0. Writing 1 to this bit clears the flag.</p>
[2]	PEI	<p>Parity Error Indicator</p> <p>This bit is set to 1 whenever the received character does not have a valid “parity bit”. Writing 1 to this bit clears the flag.</p>
[1]	OEI	<p>Overrun Error Indicator</p> <p>An overrun error will occur only after the receive data register is full and when the next character has been completely received in the receive shift register. The character in the receive shift register will be overwritten when a new character is received in the receive shift register after an overrun event occurs, but the data in the receive shift register will not be transferred to the receive data register. The OEI bit is used to indicate the overrun event as soon as it happens. Writing 1 to this bit clears the flag.</p>

UART Divider Latch Register – URDLR

The register is used to determine the UART clock divided ratio to generate the appropriate baud rate.

Offset: 0x024

Reset value: 0x0000_0010

	31	30	29	28	27	26	25	24

UART Test Register – URTSTR

This register controls the UART debug mode.

Offset: 0x028

Reset value: 0x0000_0000

Bits	Field	Descriptions
[1:0]	LBM	Loopback Test Mode Select 00: Normal Operation 01: Reserved 10: Automatic Echo Mode 11: Loopback Mode

21 Divider (DIV)

Introduction

In order to enhance the MCU performance, a divider is integrated in the devices. The divider can implement the signed or unsigned 32-bit data division operation. An error flag will be generated when the division by zero condition occurs.

Features

- Signed / unsigned 32-bit divider
- Calculate in 8 clock cycles and load in 1 clock cycle
- Division by zero error flag

Functional Descriptions

The division and modulus functions of the truncated division are related in the following way:

$$A / B = Q \dots R$$

Where “A” is Dividend, “B” is Divisor, “Q” is Quotient and “R” is Remainder. The divider requires a software trigger start signal to start a calculation by setting the “START” bit in the Divider Control Register. The divider calculation complete flag will be set to 1 after 8 clock cycles, however, if the divisor register data is zero during the calculation, the division by zero error flag will be set to 1.

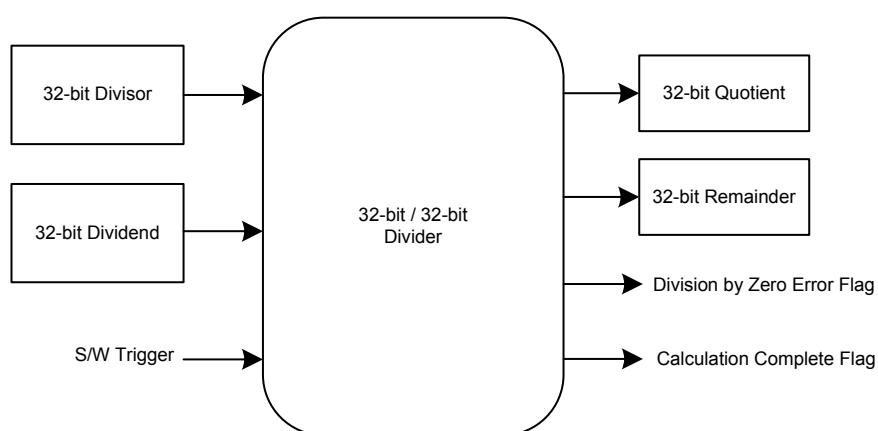

Figure 123. Divider Functional Diagram

Register Map

The following table shows the DIV registers and reset values.

Table 48. DIV Register Map

Register	Offset	Description	Reset Value
CR	0x000	Divider Control Register	0x0000_0008
DDR	0x004	Dividend Data Register	0x0000_0000
DSR	0x008	Divisor Data Register	0x0000_0000
QTR	0x00C	Quotient Data Register	0x0000_0000
RMR	0x010	Remainder Data Register	0x0000_0000

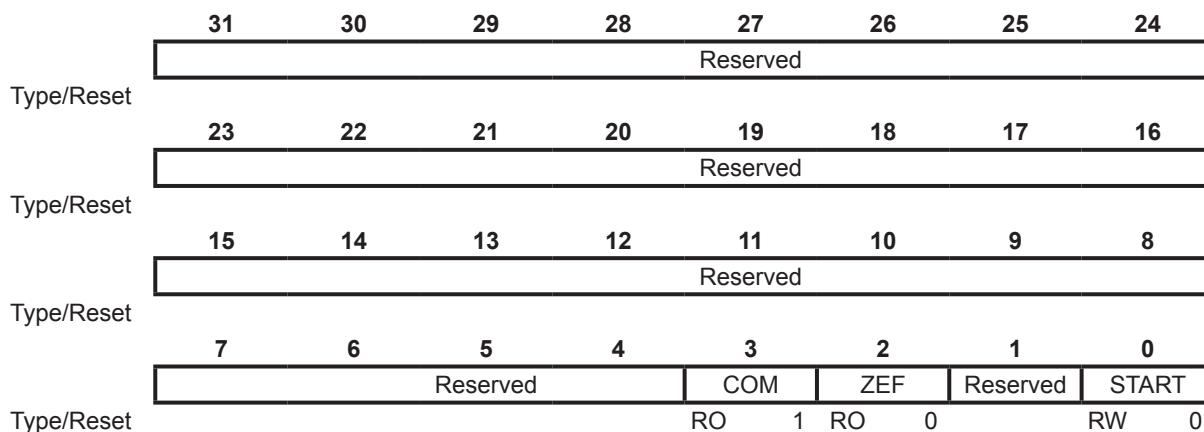

Register Descriptions

Divider Control Register – CR

This register contains the divider trigger control bit and the calculation status.

Offset: 0x000

Reset value: 0x0000_0008

Bits	Field	Descriptions
[3]	COM	Calculation Complete Flag 0: Data is invalid 1: New data is valid If this bit is set to 1, it indicates that the divider calculation is completed and data is valid. This bit is cleared to 0 by hardware after a calculation is initiated.
[2]	ZEF	Division by Zero Error Flag 0: Divisor is not zero 1: Divisor is zero This bit will be cleared to 0 by hardware after a calculation is initiated.
[0]	START	Divider calculation start trigger control bit 0: No action 1: Trigger divider to start calculation When this bit is set high, the divider will start a calculation.

Dividend Data Register – DDR

The register is used to specify the dividend data.

Offset: 0x004

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24
DDR								
Type/Reset	RW	0	RW	0	RW	0	RW	0
23 22 21 20 19 18 17 16								
DDR								
Type/Reset	RW	0	RW	0	RW	0	RW	0
15 14 13 12 11 10 9 8								
DDR								
Type/Reset	RW	0	RW	0	RW	0	RW	0
7 6 5 4 3 2 1 0								
DDR								
Type/Reset	RW	0	RW	0	RW	0	RW	0

Bits	Field	Descriptions
[31:0]	DDR	Dividend Data Register This bit field is used to specify the dividend of the divider calculation.

Divisor Data Register – DSR

The register is used to specify the divisor data.

Offset: 0x008

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24
DSR								
Type/Reset	RW	0	RW	0	RW	0	RW	0
23 22 21 20 19 18 17 16								
DSR								
Type/Reset	RW	0	RW	0	RW	0	RW	0
15 14 13 12 11 10 9 8								
DSR								
Type/Reset	RW	0	RW	0	RW	0	RW	0
7 6 5 4 3 2 1 0								
DSR								
Type/Reset	RW	0	RW	0	RW	0	RW	0

Bits	Field	Descriptions
[31:0]	DSR	Divisor Data Register This bit field is used to specify the divisor of the divider calculation.

Quotient Data Register – QTR

The register is used to store the quotient data.

Offset: 0x00C

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24
QTR								
Type/Reset	RO	0	RO	0	RO	0	RO	0
23 22 21 20 19 18 17 16								
QTR								
Type/Reset	RO	0	RO	0	RO	0	RO	0
15 14 13 12 11 10 9 8								
QTR								
Type/Reset	RO	0	RO	0	RO	0	RO	0
7 6 5 4 3 2 1 0								
QTR								
Type/Reset	RO	0	RO	0	RO	0	RO	0

Bits	Field	Descriptions
[31:0]	QTR	Quotient Data Register This bit field is used to store the quotient of the divider calculation result.

Remainder Data Register – RMR

The register is used to store the remainder data.

Offset: 0x010

Reset value: 0x0000_0000

	31	30	29	28	27	26	25	24
RMR								
Type/Reset	RO	0	RO	0	RO	0	RO	0
23 22 21 20 19 18 17 16								
RMR								
Type/Reset	RO	0	RO	0	RO	0	RO	0
15 14 13 12 11 10 9 8								
RMR								
Type/Reset	RO	0	RO	0	RO	0	RO	0
7 6 5 4 3 2 1 0								
RMR								
Type/Reset	RO	0	RO	0	RO	0	RO	0

Bits	Field	Descriptions
[31:0]	RMR	Remainder Data Register This bit field is used to store the remainder of the divider calculation result.
